1. Preface ..... i-ii
2. Leaf Shapes ..... iii-iv
3. Scientific Name Index ..... V-X
4. Identification Details ..... 1-337
5. Family Index ..... 339-346
6. Glossary ..... 347-354

M an has selected his food crops from the many thousand plant species that exist for their nutritional and flavor characteristic rather than through their ability to compete. Growing of crops, as part of agriculturefor centuries, has changed thenatural vegetation. Weeds grow on soil along with crop plants. But this growth of weed is not desirablein themonoculturesystem. Theseundesired plants depletethenutrients, water and space allotted for the intended crop, and finally causehugereduction in crop yield. Weeds, in crop field, reduceinput efficiency, interferewith agricultural operations, impair quality and act as alternate hosts for several insect pests and diseases. Some weeds release toxic substance which affects the crop growth. The obvious effect of these traits is the hike in cost of cultivation by several folds. Along with this, weeds affect and interfere in the management of all the terrestrial and aquatic resources. They endanger the native biodiversity by choking and deliberate takeover of the native plants. The animals which depend on this native biodiversity for their survival are also getting affected. On the other hand, as part of the primary producerswithin farming systems, weeds al so considered as important components of theagroecosystem. Reductions in abundances of weeds which act as hosts may affect associated insects and other taxa which are beneficial. Thus, weeds have a role within agroecosystems in supporting biodiversity more generally. Weeds play important role as resourcein pharmaceuticals and animal nutrition.

Weed biology relates to the plant attributes such as morphology, seed dormancy and germination, physiology of growth, competitive ability and reproductivebiology. Knowledge of weed biology is essential for development of both economi cally and environmentally acceptable weed management systems. It is al so essential to understand and predict how weed species, populations and biotypes evolve in response to the selection pressure primarily due to agricultural and related practices. Weed identification isthefirststep in understanding their biology.

Knowing the weeds that are competing with the desirable crops is important to understand how to manage their populations. It is said that identifi cation is half way to control. The firststep in effective weed management is the accurate identification which in turn will help in a basic understanding of the weeds' life cycle. Correct identification can bean importantstep in making surethat new weeds can beeradicated beforethey becomeestablished. Thetypes of weeds can also tell about the field and its management, and also the best form of direct control. Proper weed identification can help in selecting right herbicide to control a particular weed. Identification is important al so with respect to thetiming of theherbicide application. Sometimes correct identification can indicate that no action needs to
be taken if the identified plant is not a troublesome weed and also helps in protecting the weeds of economic importance and conserving the biodiversity. Being able to identify the weeds is important as it helps in determining the expected level of the problem as weeds vary in the extent to which they can reducethe yield and quality or to the extent to which they arebeneficial. Weed identification may form thefirststep in bal ancing theneeds for weed control with therequirementsfor biodiversity and moresustainableproduction methods.

An effort has been made to brought out this publication entitled "H and book on Weed Identification" to help in identifying the weeds easily. I hope this publication would be of great help to scientists, researchers, quarantine officials, academicians and students.

I thank ICAR for giving metheopportunity to servein this position. Thefinancial support by theDepartment of Agriculture and Cooperation, Ministry of Agriculture, under National Weed Surveillance project is duly acknowledged. Theencouragement by the present and former Directors, scientist colleagues, and technical and other staff members of DWSR is worth to recognize. The support from PI s of theA ICRP-WC centres and A rea Coordinators of the NIWS is unforgettable. The technical support by Mr. Sandeep Dhagat, Mr. Virendra Kumar Kamalvanshi and Mr.V.K.S. Meshram in shapingup this publication is acknowledged.

## G lossary

| A culeate | Covered in prickles. |
| :---: | :---: |
| Acuminate | : Tapering gradually to a protracted point. |
| Acute | : Sharp orpointed. |
| Adaxial | : A owardstheaxis, referring tothesurfaceof an organ that isclosest to theaxis in bud. |
| Annular | : Arranged in or formingaring. |
| A piculate | : A shortsharp point, notrigid, found at thetip. |
| A scending | : Arched upwards in thelower part and becomingerect in theupper part. |
| Attenuate | : Taperinggradually. |
| A uricle | : An ear shaped appendageat the baseof a leaf, leaflet or corolla lobe; or an ear-likeoutgrowth at the base of thesheath of somegrasses and other monocots. |
| Awn | : A slender, bristlelikeprojection, e.g. from the back ortip of theglumes and lemmas in somegrasses. |
| Axil | Theanglebetween onepart of a plant and another part, e.g. a branch and a leaf. |
| Beak | : A prominentterminal projection, especially of a carpel or fruit. |
| Berry | : A fleshy or pulpy indehiscentfruit with theseed(s) embedded in thefleshy tissueof thepericarp. |
| Biconvex | Convex on both sides. |
| Biennial | : Completing the full cycle of germination to fruiting in more than one, but not more than two years, and then dying. |
| Blade | : Lamina; part of theleaf abovethesheath or petiole. |
| Bract | : A leaf-likestructure, usually different in form from the foliage leaves, associated with an inflorescence or flower. |
| Bracteole | : A small bract-likestructurebornesingly or in a pair on thepedicel or calyx of aflower. |
| Broadly | : Having a length:breadth ratio between 6:5 and 1:1; if the ratio is less then the shape is described as very broadly. |
| Caducous | : Falling early beforeassociated organs aremature. |
| Caespitose | Growing densely in tufts; having short, closely packed stems. |
| Calcareous | : Composed of or containing limeor limestone. |
| Calyx | : Theoutermostfloral whorl usually consisting of sepals or a calyx tubeand cal yx lobes. |

| Capitulum | : A densecluster of sessile, or almost sessile, flowers or florets. |
| :---: | :---: |
| Capsule | : A dry fruit formed fromtwo or moreunited carpel s and dehiscing at maturity to rel easetheseeds. |
| Caryopsis | : Thegrassfruit, which hastheseed coat united with theovary wall. |
| Caudate | : Having anarrow, tail-likeappendage. |
| Cauline | : Borneon theaerial partof astem. |
| C hartaceous | : Papery. |
| Cinereous | : A gray color tinged with black. |
| Circumscissile | : Opening by atransverselinearound thecircumference. |
| Climber | : Growing moreor lesserect by leaning or twining around another structure. |
| Convolute | : A n arrangement of petalsin a bud whereeach has onesideoverlapping theneighbouring petal. |
| Cordate | : A 2-dimensional shape; heart shaped in outline, i.e. having thebasebroad and distinctly notched. |
| Costa | : A thickened, linear ridgeor themidrib of thepinnain ferns. |
| Crenate | : With obtuseor rounded teeth which either point forwardsor areperpendicular to themargin. |
| Crenulate | : M inutely crenate. |
| Crisped | : Very strongly undulate; margins which are wavy in a vertical plane, the waves themselves with secondary waves. |
| Crustaceous | : Hard, thin and brittle. |
| Culm | : The aerial stem of grasses, sedges, rushes and other monocots, bearing the cauline leaves and the inflorescence. |
| Cuneate | : A 2-dimensional shape; obtriangular, i.e. wedgeshaped. |
| Cuspidate | : Somewhat abruptly and sharply concaveand constricted into a cusp. |
| Cuspidulate | : Constricted into aminutecusp. |
| Cylindric | : A 3-dimensional shape; tubular or rod shaped with a length:breadth ratio of 2:1 to 3:2. |
| Cyme | : A n inflorescencein which each flower, in turn, is formed at thetip of a growing axis, further flowers being formed on branches arising below. |
| D ecumbent | : Spreadinghorizontally with theapex growing upwards, referring to stems. |
| D ecussate | : Having paired organswith successivepairsat rightanglesto givefour rows. |
| D ehiscent | : Breaking open at maturity to releasethecontents. |
| D entate | : With sharp, spreading, rather coarseteeth standing out fromthemargin. |

| D enticulate | : Finely dentate. |
| :---: | :---: |
| D epressed | : Flattened as if pressed down from the top or end; applied to 2 or 3-dimensional shapes, e.g. ovate and obovateor ovoid and obovoid which havea length:breadth ratio of lessthan 2:3. |
| Dichasium | : A cymein which thebranches areoppositeand approximately equal. |
| Dichotomous | : Divided almostequally into two parts. |
| Dioecious | : Having maleand femaleunisexual flowerson different plants. |
| Divaricate | : Widely spreading. |
| Echinate | : Bearingstiff, stout, prickly hairs. |
| Ellipsoid | : A 3-dimensional shape; ellipticin outlineand with alength:breadth ratio between 3:2 and 2:1. |
| Elliptic | : A 2-dimensional shape; oval in outlineand with alength:breadth ratio between 3:2 and 2:1. |
| Elongate | : Lengthened;stretched out. |
| Emarginate | : Havinga broad, shallow notch at theapex. |
| Entire | : Withoutany incisionsor teeth. |
| Erect | : Upright; perpendicular. |
| Exserted | : Protruding beyond some enclosing organ, e.g. referring to stamens which project beyond the corolla or perianth, or to valves which extend beyond the rim of a capsular fruit. Sometimes the stamens are not actually longer than thecorolla or perianth but areexserted dueto thespreading of thesegments. |
| Farinose | : Covered with mealy dustor powder. |
| Fascicle | : A cluster. |
| Fetid | : Having heavy offensivesmell. |
| Filiform | : Thread-like. |
| Fimbriate | : Fringed. |
| Flaccid | : Limp and weak. |
| Flexuose | : Zig-zagging, often referring to astem. |
| Follicle | : A dry fruit, derived fromasinglecarpel and dehiscing al ong onesuture. |
| Geniculate | : Bentabruptly, with thestructureof aknee. |
| G ibbous | : Characterized by convexity; protuberant. |
| G labrescent | : Becoming glabrous. |
| G labrous | : Withouthairs. |

| G laucous | Blue-green in colour, with a whitish bloom. |
| :---: | :---: |
| G lobular | A 3-dimensional shape; spherical or orbicular; circular in outline. |
| H astate | With a pair of basal lobes which flareoutwards; refersto aflatorgan, mostcommonly a leaf. |
| Herb | : A plant which is non-woody or woody at the base only, the above ground stems usually being ephemeral. |
| Herbaceous | Herb-like; often applied to bracts, bracteoles or floral parts that aregreen and soft in texture. |
| Hirsute | : With long and rather coarse or stiff hairs, the hairs being less rigid and erect than when referred to as hispid. |
| Hispid | With stout, rigid or bristly, erecthairs. |
| Imparipinnate | Pinnately compound with asingleterminal leaflet and hencewith an odd number of leaflets. |
| Incised | Cutjaggedly with very deep teeth. |
| Incrassate | Obsoletefattened or swollen. |
| Indumentum | Thetypeof hairiness commonly found on external parts of plants. |
| Involucre | A largebractor whorl of bractssurrounding aflower or an entireinflorescence. |
| Involute | With themarginsinrolled on theupper (adaxial) surface, referring to aleaf or other flatorgan. |
| Lactiferous | Forming or conveying milk or milky fluid. |
| Lanate | Covered with long hairs which areloosely curled together likewool. |
| Lanceolate | Lanceshaped, much longer than wide, the widest point below themiddle. |
| Leaflet | Oneof theultimatesegments of a compound leaf. |
| Ligule | Outgrowth from the inner junction of the grass leaf sheath and blade, often membranous, sometimes represented by afringeof hairs. |
| Linear | : A 2-dimensional shape: narrowly rectangular with parallel sides and a length:breadth ratio of at least 12:1. |
| Lyrate | Pinnately lobed, with the terminal lobe the largest and the laterals progressively smaller towards the base. |
| M argin | Theedgeof theleaf blade. |
| M ericarp | A 1-seeded portion of an initially syncarpous fruit which splits apart at maturity, e.g. in the A piaceae. Sometimes called a coccus. |
| M idvein | : Themain vascular supply of a simpleleaf bladeor lamina. |
| M onoecious | H aving both maleand femaleunisexual flowers on thesameindividual plant. |

| M ucro | uptly terminating an organ. |
| :---: | :---: |
| M ucronate | A bruptly tipped with a mucro, accompanied or not by a small amount of leaftissue. |
| M uricate | With numerousshorthard outgrowths. |
| M uriculate | With numerousminutehard outgrowths; adiminutiveof muricate. |
| Narrowly | : Having a length:breadth ratio between 3:1 and 6:1; if the ratio is more than 6:1 then the shape is described as very narrowly, except in the case of very narrowly obl ong which istermed linear. |
| Nut | Dry indehiscent 1-celled fruit with a hard pericarp. |
| Obcordate | A 2-dimensional shape; broad and notched at thetip; heartshaped but attached at the pointed end. |
| Oblanceolate | Lanceolate, with themorepointed end at thebase. |
| Oblong | A 2-dimensional shape; rectangular with alength:breadth ratio between 3:2 and 2:1. |
| Obovate | A 2-dimensional shape: similar to ovatebut attached at the narrower end and with a length:breadth ratio between 3:2 and 2:1. |
| Obscure | N ot clearly seen or easily distinguished. |
| Obtuse | Blunt or rounded at theapex, theconverging edges separated by an anglegreater than 90 degrees. |
| Ocrea | Sheath formed at thenodeof astem by thefusion of two stipules. |
| Opposite | Describing leaves or other organs which are borne at the same level but on opposite sides of the stem; of floral parts, on thesameradius. |
| Orbicular | Of circular outline. |
| Ovate | : A 2-dimensional shape; resembling a section through the long axis of an egg, attached near the broader end and with a length:breadth ratio between 3:2 and 2:1. |
| Ovoid | A 3-dimensional shape; egg shaped; ovatein outline. |
| Palmate | Describing aleaf which isdivided into several leaflets which arisefromthesamepoint. |
| Papillose | : A small nipplelikeprojection, such as a protuberanceon theskin. |
| Pappus | A tuft (or ring) of hairs, bristles or scales borneabove the ovary and outsidethe corolla in A steraceae and possibly representing thecalyx; often persisting as atuft of hairs on afruit. |
| Paripinnate | Pinnate with an even number of leaflets and without a terminal leaflet. A tendril may beterminal on the leaf. |
| Pedicel | The stalk of an individual flower. In a singleflowered inflorescence, may refer to a peduncle, or both peduncleand pedicel when undifferentiated. A Iso used herefor thestalk of a spikelet in Poaceae. |
| Peduncle | Thestalk of an inflorescence. |

| Peltate | Attached to thestalk at a point within themargin, i.e. on thelower surface. |
| :---: | :---: |
| Peltate | : Attached to thestalk at a point within themargin, i.e. on thelower surface. |
| Pendulous | : Drooping; of ovules, attached at thetop of theovary and hanging downwardsfrom an apical placenta. |
| Perennial | : With alifespan extending over morethan two growing seasons. |
| Petiole | : Thestalk of aleaf. |
| Phyllaries | : Oneof theinvolucral bractssubtending theflower head of a compositeplant. |
| Pilose | : With slightly stiffened distinct hairs ascending fromthesurface. |
| Pinnate | : With thesamearrangement as a feather; divided into pinnae; once-compound. |
| Pinnatifid | Lobed approximately halfway to midrib. If divided almost to the midrib, then described as deeply pinnatifid or pinnatisect. |
| Pinnatisect | : Lobed almost to baseor midrib. |
| Procumbent | : Trailing or spreading along theground but not rooting at thenodes, referring tostems. |
| Prostrate | : Lying flat ontheground. |
| Puberulent | : Covered with very shortfinestraighterecthairs(puberulous). |
| Pubescent | : Covered with short, softhairs. |
| R aceme | : An indeterminateinflorescencewith a simple, elongated axis and pedicellateflowers. |
| Rachilla | : Themain axis of a grass spikelet. |
| Rachis | : Themain axis of thespikeor other inflorescenceof grasses; theaxis of a pinna in a bipinnateleaf. |
| Radiate | Arranged around a common centre; used hereespecially to describean inflorescence of A steraceaewith marginal, female or neuter, ligulate ray-florets and central, perfect or functionally male, tubular, disc florets. |
| Rambling | : Puttingoutlong shoots and growing over walls or other plants. |
| Ray | : Themarginal portion of theinflorescenceof A steraceaeand A piaceaewhen distinct fromthedisc. |
| Reflexed | : Bent orturned downward. |
| Reniform | : A 2-dimensional shape; kidney shaped in outline. |
| Reticulate | : Forming a network or reticulum. |
| Rhizome | A creeping stem, usual ly below ground, consisting of a series of nodes and internodes with adventitious roots. |
| R hombic | A 2-dimensional shape; diamond shaped in outline with the broadest axis in the middle and with a length:breadth ratio between 3:2 and 2:1. |

: A tuft of leaves or other organs resembling the arrangement of petals in a rose, ranging in form from a hemispherical tuft to aflat whorl.
A usually dry fruit which splits longitudinally into indehiscent or tardily dehiscent parts (mericarps or cocci). cocci).
: A plant of thefamily A piaceae, Cyperaceae.
: A free or almost free part or subdivision of an organ. Calyx and corolla segments are called sepals and petals respectively. In thecaseof undifferentiated dicotyledonousflowers, thesegments arecalled floral segments.
: Toothed so asto resembleasaw; with regular, asymmetricteeth pointing forward.
: Withoutastalk.
: A woody plant usually less than 5 m high and many-branched without a distinct main stem except at ground level.
: Notdivided,e.g. applied toaleaf notdivided intoleaflets.
: With deep wavelikeindentations in a horizontal planeal ong themargin.
: Usually used to describeflowerswhich arebornesingly, and not grouped into an inflorescence.
: A largebractensheathing an inflorescenceor its peduncle.
: Spoon shaped; broad at thetip and narrowed towardsthebase.
: A nunbranched inflorescence of sessileflowers or spikelets.
: Thegrassflowerhead, generally composed of 2 glumes and oneor moreflorets.
: A stiff, sharp, pointed structure, formed by modification of a plantorgan.
: Endingin aspine; modified toformaspine.
: Star shaped, usually referring to hairs with radiating branches.
: A stalk or supportsuch as thepetiole of a frond or thestalk of an ovary or fruit.
: Havingastalk or stipe, usually of an ovary or fruit.
: One of a pair of leaf-like, scalelikeor bristle-likestructures inserted at the base or on the petiole of a leaf or phyllode.
: The creeping stem of a rosetted or tufted plant, giving rise to another plant at its tip, or in Drosera a vertical underground stem connecting the tuber with the aboveground parts and bearing adventitious roots.
A slender organ formed from a modified stem, leaf or leaflet which, by coiling around objects, supportsa climbing plant.

| Terete | : Circular incross-section. |
| :--- | :--- |
| Terminal | : Attheapex or distal end. |
| Tomentose | : Covered with not very long cottony hairs, more or less felted together, shorter and less dense than |
| lanate. |  |

## A bel moschus ficulneus (L.) Wight \& Arn.

Common Name : Native rosella Family : Malvaceae

Habit: An erect undershrub, grows to a height of 0.5 to 1.5 m .

Stem: Simple, and short hairy, sometimes prickly, usually thick and fistular.

Leaves: $\quad 5-8 \mathrm{~cm}$ long, $4-7 \mathrm{~cm}$ wide, circular, heartshaped at base, toothed, rough on both sides, 35lobed.

Flowers: The flower stalks occur at the end of branches or in leaf axils. They are covered with velvety hairs. The flowers are $5-7 \mathrm{~cm}$ across. The flowers have short stalks and are white, turning pink, with a dark purple spot in the centre.

Fruits: Capsule $3-3.5 \mathrm{~cm}$ long, $1.5-2 \mathrm{~cm}$ across, 5 angular, ovoid, simple, hairy, glabrescent, valvesmembranous.

Seeds: 3 mm across, globular, black, glabrous to

## A belmoschus moschatus M edik.

Common Name : Musk mallow<br>Family : Malvaceae

## A butilon hirtum (Lam.) Sweet.

Common Name : Florida keys Indian mallow Family : Malvaceae

Habit: Perennial herbor undershrub, 0.5-2mtall.
Stem: Velvetty, branchletsviscid.
Leaves: $\quad 4-18 \mathrm{~cm}$ long and broad, densely stellate, glutinous hairy on both sides mixed with simple hairs, more so on the nerves beneath; usually broadly ovate or ovate-cordate at base, acute to acuminate at apex, crenulate-dentate or serrate, yell owish, yellowish green to green.

Flowers: Orange-yellow or yellow;axillary, solitary.
Fruits: Schizocarp densely stellate, globose. M ericarps $27-30$, acute at the back, oblong, $10-12 \mathrm{~mm}$ long, $6-8 \mathrm{~mm}$ broad.

Seeds: Reniform, 2-2.5 mm across, with minute, shining, stellatehairs.

## A butilon indicum (L.) Sweet.

Common Name : Country mallow<br>Family : M alvaceae

Habit: Anerect annual shrub, 1-2mtall.
Stem: velvety-pubescent.
Leaves: Circular-ovate or heart-shaped with coarsely crenate-serrate margins. The leaves are alternately arranged, and have long stalks and havevelvety, soft, palehairson them.

Flowers: Orange-yellow flowers, 2-3 cm across, occur solitary in axils, on longstalks.

Fruits: Circular in shape, consisting of 11-20 radiating hairy carpels, brown when dry; each carpel is flattened, somew hat boat shaped.

Seeds: Ovateor sub-orbicular, dull black.

## Acalypha indica L.

## Common Name : Indian copperleaf Family : Euphorbiaceae

Habit: Erect annual herb; up to 60 cmtall.
Stem: Branches numerous, long, ascending, angular, finely pubescent.

Leaves: $\quad 2.5-7.0 \mathrm{~cm}$ long and 2-2.5 cm broad, ovaterhombic, with long petiole, arranged spirally; blades acute, marginscrenate-serrate.

Flowers: Flowers unisexual, stalkless, borne on numerous lax, erect, elongate axillary spikes longer than the leaves. Male flowers are minute, crowded distally. Female flowers are scattered along the inflorescence axis, each subtended by a conspicuous semi-cupular leaflike, toothed, green bract, nearly 7 mm long.

Fruits: Capsules, three valved, covered with persistentbracts.

Seeds: Ovoid,smooth and palebrown.

## Acanthospermum hispidum DC.

## Common Name : Bristly starbur <br> Family : Asteraceae

Habit: Perennial herb or undershrub, 0.5-2mtall.
Stem: Densely hairy, dichotomous (Y-shaped) branching, branches numerous, long, ascending, angular, finely pubescent.

Leaves: Elliptic, oblanceolate or obovate, $1.5-7 \mathrm{~cm}$ long and $0.7-2 \mathrm{~cm}$ wide, acute or obtuse at apex, attenuate and subpetiolate at base, margins shallowly serrate, whitish piloseon both surfaces.

Flowers: Yellow, borne in heads in the forks of dichotomousbranches.

Fruits: Achenes triangular covered with stiff hooked hairs and have either a straight or curved pair of spines at thetop.

## Achyranthes aspera L.

## Common Name : D evil's horsewhip <br> Family : Amaranthaceae

Habit: | An erect or procumbent, annual or perennial |
| :--- |
| herb with spreading branches, usually up to 1 |
| mtall, often with awoody base. |

Stem: | Angular, ribbed, pubescent, simple or |
| :--- |
| branched from the base, often reddish- |
| purplish tinged. |

Leaves: | Opposite, thick, ovate elliptic or obovate- |
| :--- |
| rounded, but variable in shape and size, $4-12$ |
| cm long and up to 8 cm wide, velvety- |
| tomentose. |

Flowers: | Greenish-white, numerous, in axillary or |
| :--- |
| terminal spikes up to 75 cm long; bracts |
| membranous, oblong, enclosed in the |
| hardened parianth. |

Fruits: | Utricle, oblong-cylindric, truncate at apex, |
| :--- |
| rounded at base. |

Seeds: $\quad$| Reddish-brown, sub-cylindrical. |
| :--- |

# Aerva javanica (Burm.f.) Schult. 

Common Name : D esert cotton<br>Family : Amaranthaceae

H abit: Perennial herb, 0.3-1.5mtall .
Stem: Frequently woody; simple or with long, ascending, sometimes intricate branches. Stem and branches terete, striate, more or less densely whitish or yellowish-tomentose or pannose, when dense the indumentum often appearingtufted.

Leaves: Alternate, very variable in size and form, from narrowly linear to suborbicular, densely whitish or yellowish tomentose but usually more thinly so and greener on the upper surface, margins planeor moreor lessinvolute, sessileor with a short and indistinct petiole.

Flowers: Flowers dioecious. Spikes sessile, cylindrical, dense and stout to slender and interrupted with lateral globose clusters of flowers. Male plants al wayswith moreslender spikes.

Fruits: Capsule1-1.5mm, rotund, compressed.
Seed: $\quad 0.9-1.25 \mathrm{~mm}$, round, slightly compressed, brown or black, shining and smooth or very
 faintly reticulate.

## Aerva Ianata (L.) Juss.ex Schult.

Common Name : M ountain knot-grass<br>Family : Amaranthaceae

## Aeschynomene indica L.

## Common Name : Indian jointvetch <br> Family : Fabaceae

Habit: Annual undershrub.
Stem: Much branched, branches slender, glabrous, slightly muricate with prickle like glandular outgrowths.

Leaves: Leaves arecompound, 5-10 cm long, with 15-30 pairs of narrow needlelike leaflets, 1-1.5 cm long, rounded at thetips.

Flowers: Pale yellow flowers are borne in few flowered racemes. Flowers are about 1 cm long, peaflower shaped.

Fruits: Pods linear, flat, glabrous, smooth, upper margin entire and lower indented, 6-8 jointed with central prominent wrinkles on each joint.

Seeds: 2-3mmlong, smooth and black.

## Ageratum conyzoides L.

| Common Name | : G oat weed |
| :--- | :--- |
| Family | $:$ Asteraceae |

Habit: Erect, often branched, annual herb and often decumbent; up to 120 cm tall.

Stem : Much branched and rooting at the base; stem, nodes and younger parts with rather long, partly crispy hairs.

Leaves: Opposite or the upper alternate, broadly ovate or rhomboid-ovate to triangular, 2-10 cm long and $1.5-5 \mathrm{~cm}$ wide, apex subacute, margins crenate, ciliate, base cuneate, more or less hairy on both surfaces.

Flowers: Flowers in flat-topped, peduncled (5-17 mm long) corymbs ( $60-70$ flowers). Flowers white, paleblueorvioletwith adisagreeableodour.

Fruits: Achene oblong, 5-angular, black with pale base, glabrous or slightly hairy, $1.5-2 \mathrm{~mm}$ long with awn-tipped, serratepappus-scales.

## Ageratum houstonianum Mill.

## Common Name : Flossflower <br> Family : Asteraceae

Habit: Annual, erect and often much branched herb; $0.3-1 \mathrm{mtall}$.

Stem: Leafy, piloseor villouswith spreading hairs.
Leaves: Opposite, on rather long, slender petioles, very thin, broadly deltoid-ovate, $4-8 \mathrm{~cm}$ long, obtuse or acute, base cordate, coarsely crenate, thinly villous-hirsute.

Flowers: Heads numerous, lavender or pale blue, many flowered.

Fruits: Achenes black, 1.2 mm long.

## Alternanthera bettzickiana (Regol.) Voss.

## Common Name : Red calico plant <br> Family : Amaranthaceae

Habit: Perennial herb, 20-50 cmtall.
Stem : Erect or creeping, much branched, apical part quadrangular, basal part cylindric, hairy at apex and nodes.

Leaves: Green or red, or tinged red or yellow, oblong, oblong-ovate, or spatulate, hairy when young, glabrescent, base acumi nate, margin undulate, apex acuteor obtuse, with a mucro.

Flowers: Heads 2-5, terminal or axillary, 5-10 mm, sessile.

Fruits: Infructescence very much likethe inflorescence, i.e. consisting of tightly packed bracts interspersed with pale hairs. Individual fruits slightly more than 1 mm long, enclosed in the
 persistent perianth segments and bracts.

Seeds: Discoid, about 1mm diameter,testabrown.

## Alternanthera brasiliana (L.) Kuntze.

## Common Name : Brazilian joyweed <br> Family <br> : Amaranthaceae

| Habit: | Herbsor subshrubs, annual or perennial. |
| :--- | :--- |
| Stem: | Erect, villous, glabrate. |
| Leaves: | Sessile; bladeovateto lanceolate, $1-7 \times 0.7-1 \mathrm{~cm}$, <br> herbaceous, villous. |
| Flowers:Terminal and axillary, pedunculate; heads <br> white, globose, $0.7-1 \mathrm{~cm}$ diameter. |  |
| Fruits:Utricle, included within tepals, brown, <br> ellipsoid, 2 mm, apexacute. |  |
| Seeds: $\quad$ Ovoid-oblong, 1.4 mm. |  |

## Alternanthera paronychioides A. St.-Hil.

## Common Name : Smooth joyweed <br> Family : Amaranthaceae

Habit: Prostrate, annual creeping herb.
Stem: Stem with long crisped hairs on the younger parts.

Leaves: Leaf blade is inverted-lance shaped or spatula shaped, $1.5-2 \mathrm{~cm}$ long and $0.3-0.5 \mathrm{~cm}$ wide, tip obtuseto rounded.

Flowers: Stalkless flower-heads are ovoid to spherical, often hairy at basewith whitepapery flowers.

Fruits: Utricleorbicular

Seeds: Discoid, 1mmacross, faintly reticulate.

## Alternanthera philoxeroides (M art.) G riseb.

## Common Name : Alligator weed <br> Family : Amaranthaceae

Habit: A perennial herb which grows as an emerged, aquatic plant, rooted in the soil or in the substratebelow shallow water.

Stem: Fistular.
Leaves: Dark-green waxy leaves which are lanceshaped and opposite. They are 12-14 cm long and $1.5-2.5 \mathrm{~cm}$ wide.

Flowers: The inflorescence is white, ball-shaped, 1.5 cm in diameter and papery.

Seeds: Disc shaped to flattened wedge shaped, 0.7-0.9 mm diameter, reddish brown, smooth and undulated.

Utricle membranous and rarely open to release the seed. It does not always set viable seed under field conditions, but reproduces vegetatively fromaxillary buds at each node.

## Alternanthera pungens H. B \& K.

## Common Name : Khaki weed <br> Family : Amaranthaceae

## Alternanthera sessilis (L.) DC.

## Common Name : Sessile joyweed <br> Family : Amaranthaceae

Habit: A prostrate or procumbent, annual or perennial herb.

Stem : Thestems aregenerally prostrate, 0.2-1 mhigh, with strong creeping tap roots, often rooting at the nodes, sometimes floating, creeping or ascending at the tips, cylindrical and slightly hairy, with numerouserect branches.

Leaves: Simple, opposite, shortly petiolate or sessile, broadly lanceol ateor spatulateto almostlinear, $0.6-5 \mathrm{~cm}$ long, and $0.3-1 \mathrm{~cm}$ wide. They are attenuated at the base, and the apex is acute to blunt, with entire, glabrousor pilosemargins.

Flowers: Flowers inconspicuous, white, borne in small, axillary, dense, sessile, silvery-whiteclusters of compressed spikes.

Fruits: Utriclecordiform and strongly compressed.
Seeds: Dark-brown to black, disc-shaped and shiny,
 about0.8-1mmin diameter.

## Alysicarpus bupleurifolius (Linn.) D C.

## Common Name : Sweet alyce clover Family <br> : Fabaceae

Habit: An erect or decumbent-ascending, annual herb.

Stem: Glabrous exceptalineof appressed hairs.
Leaves: Linear-lanceolate to oblong, often the lower ones rounded, marginsentire.

Flowers: Bluish pink inlaxterminal racemes.
Fruits: Pod stipitate, subterete, glabrous, 4-gonous, 26jointed.

Seeds: Ovoid to rounded; smooth olive brown or black.

## Alysicarpus Iongifolius Wight \& Arn.

## Common Name : Long leaved alyce clover <br> Family : Fabaceae

Habit: Herbsorsubshrubs, annual or perennial.
Stem: Slightly striate, glabrous.
Leaves: Unifoliolate; petioles 3-10 mm long, leaflets 515 cm long, $0.9-1.9 \mathrm{~cm}$ broad, oblong or lanceolate, obtuse or subacute, base subcordate, glabrous above, appressly hairy on thenerves beneath.

Flowers: Inflorescence dense spicate raceme, $15-30 \mathrm{~cm}$ long. Flowersyellow, flushed with red.

Fruits: Pods 0.9-1.3 cm long, 2-2.5 mm broad, shortly stalked, slightly moniliform, terete-compressed, 4-6 jointed, minutely pubescent, reticulately veined.

Seeds: Ovoid-oblong, 1.4mm.

## Alysicarpus monilifer (L.) DC.

## Common Name : Alyce clover Family <br> : Fabaceae

Habit: Low growing, much branched, annual or perennial herb, $5-50 \mathrm{~cm}$ tall.

Stem: Much branched, branches pilose, hairs long and spreading.

Leaves: Simple; ovate, elliptical or lanceolate, cordate at the base, $2.5-7.5 \mathrm{~cm}$ long, prominently nerved, glabrous or sparsely pubescent beneath.

Flowers: Racemes spicate, axillary and terminal, 1-15 cmlong; flowerslax to denseal ong racemes.

Fruits: Pods distinctly moniliform, 3- to 5-jointed, 1-2 cm long, calyx not longer than first joint; glabrous or sparsely pubescent; articles 2.5-3 mm long and 2-3 mm wide, with a smooth to reticulatesurfacesculpture.

Seeds: Ovoid,smooth, shining brown.

## Alysicarpus ovalifolius (Schumach.) J. Leonard.

## Common Name : Over-leafed alysicarpus Family : Fabaceae

Habit: A nnual herb, erect-spreading, 20-60 cmtall.
Stem: Stiff and pubescent.
Leaves: Unifoliolate, leaflets $1-10 \mathrm{~cm}$ long, $0.6-3 \mathrm{~cm}$ broad, elliptic or oblong to narrowly lanceolate, acute to emarginate, mucronate, puberulous.

Flowers: Inflorescence terminal or leaf-opposed or paniculate, peduncle $3-4 \mathrm{~cm}$ long. Flowers orange-buff to pink or reddish violet, rarely whitish.

Fruits: Pod 1.8-2.5 cm long, 2-8-seeded, not constricted, each 1-seeded part 2.5-4 mm long, $2.0-2.5 \mathrm{~mm}$ broad, puberulous.

Seeds: Brown, slightly compressed, oblong-ellipsoid.

## Alysicarpus vaginalis (L) DC.

## Common Name : White moneywort Family : Fabaceae

| H abit: | A decumbent-ascending or prostrateperennial <br> herb. |
| :--- | :--- |
| Stem: | $30-90 \mathrm{~cm}$ tall with glabrous branches. | Leaves: | Simple, variable in size and shape on a single |
| :--- |
| plant, 0.7-4 cm long and $0.7-1.5 \mathrm{~cm}$ wide, |
| broadly to narrowly oblong or obovate, base |
| subcordate or truncate, apex acute or |
| emarginate, usually hairy. |

## Amaranthus spinosus L.

## Common Name : Spiny pigweed <br> Family : Amaranthaceae

## Amaranthus viridis H ook. F.

$$
\begin{array}{ll}
\text { Common Name } & \text { : Slender amaranth } \\
\text { Family } & \text { : Amaranthaceae }
\end{array}
$$

Habit: Anerectannual herb.
Stem: 6 to 100 cm tall, glabrous to pubescent, pubescent especially upwards.

Leaves: Glabrousor pubescent on theveins of thelower surface; petioles long (up to 10 cm ), occasionally longer than theblade; bladeovate to rhombic-oblong, $2-7 \times 1.5-5.5 \mathrm{~cm}$, base tapered to blunt, tip rounded, minutely mucronate, barely to clearly emarginate.

Flowers: Green, unisexual, mal eand female intermixed, in slender axillary toterminal paniculatespikes 2-12 cm long and 2-5 mm wide, or in dense axillary clusters in thelower part of thestem.

Fruits: Capsule nearly globose $1.25-1.75 \mathrm{~mm}$ long, not rupturing or rupturing irregularly, surface rough.

Seeds: $\quad$ 1-1.25 mm, round, slightly compressed, dark brown to black with a paler thick border.

## Ammannia baccifera L.

## Common Name : Blistering ammannia <br> Family : Lythraceae

Habit: Anerectannual herb.
$\begin{array}{ll}\text { Stem: } & \begin{array}{l}10-50 \mathrm{~cm} \text { tall, some what 4-angled, slender, } \\ \text { smooth and moreorlesspurplish. } \\ \text { Leaves: } \\ \\ \\ \text { The leaves are oblong, oblanceolate, or } \\ \text { narrowly elliptic, about } 3.5 \text { centimeters long; } \\ \text { those on the branches are very numerous, } \\ \text { small, and } 1 \text { to } 1.5 \text { centimeters long with } \\ \text { narrowed base and pointed or somewhat } \\ \text { rounded tip. }\end{array} \\ \text { Flowers: } \begin{array}{l}\text { The flowers are small, about } 1.2 \mathrm{~mm} \text { long, } \\ \text { greenish or purplish, and borne in dense } \\ \text { axillary clusters. }\end{array} \\ \text { Fruits: } \begin{array}{l}\text { The capsules are nearly spherical, depressed, } \\ \text { about } 1.2 \text { mm in diameter, purple, and } \\ \text { irregularly circumsscissabovethemiddle. }\end{array} \\ \text { Theseedsareblack. }\end{array}$

## A nagallis arvensis L .

## Common Name : Scarlet pimpernel Family : Primulaceae

Habit: A low-growing annual, up to 30 cm tall.
Stem: Branching, decumbent, repent, or erect, herbaceous, 4-angled, glabrous to pubescent, sometimes rooting at thenodes.

Leaves: Opposite, entire, sessile, ovate, to 2 cm long, 1.3 cm broad, clasping or not, with brown speckles below, variously pubescent, margins somewhattuberculate.

Flowers: Solitary flowersarisefromthearea between the stem and leaves (leaf axils) and occur on relatively longstalks(pedicels); brightblue.

Fruits: Capsule, globose.

## Andrographis paniculata Wall.

## Common Name : Kalmegh <br> Family : A canthaceae

Habit: An annual herb.
Stem: Much branched, 0.3-1 mtall;stemand branches sharply quadrangular with longitudinal furrows and wings on the angles of the younger parts.

Leaves: Simple, opposite, short-petioled, glabrous, elliptic to lanceolate, narrowed at both ends, acuteat apex, $2.5-8 \mathrm{~cm}$ long and 2.5 cm wide.

Flowers: Flowers small, white with purplish blotches or rose-coloured, bornein lax, spreading terminal and axillary panicled racemes.

Fruits: Fruit a linear-oblong, compressed capsule, acuteat both ends, 1.9 cm long and 0.3 cm wide.

Seeds: Numerous, subquadrate and yellowishbrown.

## Anisomeles indica (L.) O. Kuntze.

## Common Name : Indian catmint <br> Family : Lamiaceae

Habit: An erect, camphor-scented, variable herb or woody shrub, up to 2 mtall.

Stem: Quadrangular and softy pubescent.
Leaves: Thick, broadly ovate, $4-10 \mathrm{~cm}$ long and 2-6 cm wide, base rounded or subcordate, apex acute, margins crenate-serrate, hairy to softy pubescent on both sides; petioles $1-7.5 \mathrm{~cm}$ long.

Flowers: Flowers borne in dense whorls in leaf axils below and in dense, spiked inflorescences, 8-32 cm long above; light purple or dark red with a deep bluelowerlip.

Fruits: Nutlets 2.5 mm long, broadly ovoid with rounded ends, smooth, polished, turning black when ripe.

## Anisomeles malabarica R.Br.

## Common Name : M alabar catmint <br> Family : Lamiaceae

Habit: Anerect, aromaticherb, up to 2 mtall.
Stem : Softly whitetomentose.
Leaves: Oblanceolate, serrate, acute or acuminate, base truncate, cartaceous.

Flowers: Pink-violet, in axillary and terminal dense spikes.

Fruits: Nutlets 2.5 mm long, broadly ovoid with rounded ends, smooth, polished, turning black when ripe.

## Antigonon leptopus H ook. \& Arn.

## Common Name : Coral vine <br> Family : Polygonaceae

Habit: Climbing perennial vine.
Stem: The vine can easily grow to 30-40 ft (9-12 m) in length and uses its tendrils to rapidly climb up, over and upon any nearby object.

Leaves: Ovate, heart-shaped and undulate, soft, pronounced veinson underside.

Flowers: Inflorescence paniculate, the branches bearing flowers in clusters along the rachis, the rachis tip tendrillate; flowers reddish or light pink, or white. Theactual flowers aretiny but thesepals are larger and provide the brilliant colors that range from white to rose-pink to deep coral flowered varieties.

Fruits: Achenes conical, sharply 3-angled above.

## Apluda mutica L.

## Common Name : Mauritian grass Family <br> : Poaceae

Habit: A rambling perennial grass.
Stem: Culm up to 3 m long, rooting from the lower nodes, glabrous, much branched in upper part, branchesflexuous.

Leaves: Leaf-blades are flat, 5-25 cm long, 2-10 mm wide, cut-off at thetip.

Flowers: Inflorescence a leafy panicle, solitary, simple raceme or spike, each enclosed in a spathe. Spikelets in trios, onesessile, two pedicelled.

Fruits: Caryopsisellipsoid.

## Argemone mexicana L.

## Common Name : Mexican prickly poppy Family : Papavaraceae

Habit: Anerect prickly annual herb.
Stem: Upto 1.2 mtall with yellow sap.
Leaves: Sessile, with slightly incised undulated margins and white veins, spiny on margins, midrib and veins beneath.

Flowers: Yellow, 2.5-7.5cmin diameter, with 4-6petals.
Fruits: Capsules 2-4 cm long, elliptic or oblong, prickly, rarely unarmed.

Seeds: Numerous, small, round, blackish-brown, deeply reticulateand pitted.

## Arundo donax (L.)

## Common Name : Giant reed <br> Family : Poaceae

Habit: A very tall and robust, bamboo-like, perennial grass.

Stem: Spreading clumps of thick culms.
Leaves: $\quad 30-60 \mathrm{~cm}$ long, 5 cm wide, arranged conspicuously in two opposite ranks on the culms. Themargins aresharp to touch.

Flowers: Inflorescence is a $30-60 \mathrm{~cm}$ long, purplish, aging to silver, plume that stands above the foliage.

## Asphodelus tenuifolius Cav.

## Common Name : Onion weed <br> Family : Liliaceae

Habit: An annual, slender herb with a short root stock.
Stem: Erect, hollow, cylindrical stem up to 50 cm high, shorter than scape.

Leaves: Numerous, all basal, hollow, slender, gradually acuminateto a point, 10 to 40 cm long the base sheathing, smooth to minutely hairy, seeming to rise as a 'bunch' from the soil, usually shorter than scapes.

Flowers: Scapes many from the base, much branched, $30-60 \mathrm{~cm}$. Flowers laxly racemose, light purple, with whitefading.

Fruits: Capsuleglobose, faintly 3-gonous
Seeds: Triangular ,pitted, black grayish in color, 2-3 mmlong, finely and shortly papillose.

## Asteracantha Iongifolia (L.) N ees.

## Common Name : Waterleaf <br> Family : Acanthaceae

Habit: An erect, thorny, strigose-hispid herb; up to 60 cmtall.

Stem: The stem is square and thickened at nodes and hairy. Thebark isdark brown.

Leaves: Whorled, lanceolate, dentate, acuminate, base cuneate, scabrous, sub-sessile.

Flowers: Pink or blue-purple; sessile, in axillary whorls, surrounded by yellowish stiff spines.

Fruits: Capsule 1 cm . long, linear oblong, pointed glabrous, and about 8seeded.

## Asystasia gangetica T. A nders.

## Common Name : Ganges primrose Family : Acanthaceae

Habit: Suberect to climbing subshrub.
Stem: 4-angled with piloseto glabrescent twigs.
Leaves: Lamina elliptic-ovate to deltoid, 2-5 x 1.5-3.5 cm with up to 2 cm long petiole, greypubescent to glabrate, base truncate to rounded, the margins crenulate to entire, apically acuteor shortly acuminate.

Flowers: Flowers in terminal, 1-sided, lax raceme; yellow to creamy-white with purplestreaks on throat.

Fruits: Capsule oblong, up to 2.8 cm long including stipe, pubescent, 4-seeded.

Seeds: Irregularly obovate, 3-5 x 0.5-3 mm, tuberculaterugose.

## Atylosia scarabaeoides (L.) Benth.

## Common Name : Showy pigeonpea Family : Fabaceae

Habit: A perennial climber or trailer, forming thick mats.

Stem: Stems often reddish, covered with short, ferruginous pubescence. Root-stocks woody and slender.

Leaves: Trifoliate, leaflets up to 4.5 cm long and 2.2 cm wide, ellipticto elliptic-oblong, acuteto obtuse, subcoriaceous, grey-pubescent and strongly nerved beneath.

Flowers: Yellow, 0.8 cm long, in $1-2 \mathrm{~cm}$ long corymbose racemes, or reduced to 1-2 on short peduncles.

Fruits: $\quad$ Podsup to 2.5 cm long and 6 mm wide, densely clothed with golden, oppressed hairs, 2-6 seeded.

Seeds: $\quad 5 \mathrm{~mm}$ long and 3 mm wide, reddish, mottled brown or black.

## A vena Iudoviciana (L.) Nees.

## Common Name <br> : Wild oat <br> Family <br> : Poaceae

Habit: An annual tufted grasswith erectculms.
Stem: Culm heightvaries from 25 to 120 cm .
Leaves: Blades are coloured dark green, grow up to 40 cm and show a membraneous ligule, which is 1-6 mm long and often irregularly toothed. Sheaths aresmooth or slightly hairy, especially in younger plants.

Flowers: The inflorescence is a loose, open panicle with 2-3-flowered pedicelled spikelets. As a specific trait of A vena species, lemmas have 2-3 awns arising from the back which are mostly darkcoloured, bent and $3-4 \mathrm{~cm}$ long. Each of the 2-3 florets has an oval abscission scar at its base, causing them to fall separately.

Grains: $\quad 6-8 \mathrm{~mm}$ long.

## Axonopus compressus (Sw.) Beauv.

## Common Name : Blanket grass <br> Family : Poaceae

Habit: A creeping, stoloniferous, perennial grass.
Stem: Culmserect, 15 to 16 cm high, solid, Iaterally compressed, thestolonsstrongly branched, rooting at each node.
Leaves: Leaf sheaths strongly compressed, finely hairy along the outer margin, otherwise smooth, the nodes densely pubescent; ligule very short, fringed with short hairs; blade lanceolate, flat, 4 to 15 cm long, 2.5 to 15 mm wide, with broadly rounded base and blunt apex, often fringed with hairs;.

Flowers: Inflorescencewith slender peduncles, two to four, seldom eight, developing successively, the secondary and succeeding inflorescences remaining hidden inside the sheath but ultimately projecting beyond the sheath. Peduncle smooth, bearing at its apex two slender, onesided spikes, usually 5 to 8 cm long, often with a third below them, rarely a fourth.

Fruits: Spikelets oblong, rather acute, 2 to 2.5 mm long, 1 to 1.25 mm wide, pale green or tinged with purple, solitary on
 alternate sides of rachis and forming two rows, ciliate on themargins.

G rains: Caryopsisyellowish brown, about 1.25 mm long.

## Barleria cristata L.

## Common Name : Crested Philippine violet Family : Acanthaceae

Habit: Anerector diffuseherb, up to 1 mtall.
Stem: Appressed hairy, densely hairy at the nodes; branches and bracteoles spiny.

Leaves: Elliptic-oblong to Ianceolate, $6.3-13 \mathrm{~cm}$ Iong and $2.5-4.5 \mathrm{~cm}$ wide, acute or acuminate, hairy on both sides.

Flowers: Bluish-purple, pink or white, pubescent outside, born in 1-4 flowered axillary and terminal spikes.

Fruits: Capsules 1.6 cm long, ellipsoid or ablong, acute at both ends, 4-seeded.

Seeds: 4 mm in diameter, orbicular, compressed, silky-hairy.

## Barleria prionitis L.

## Common Name : Porcupine flower Family : A canthaceae

Habit: A much-branched, perennial, usually prickly shrub, up to $3 m$ tall.

Stem : With whitish stems and rounded branches.
Leaves: Opposite, elliptic, acuminate, lineolate, bristletipped, entire, $9-18 \mathrm{~cm}$ long and $2.5-5.7 \mathrm{~cm}$ wide, glabrous above, young leaves often pubescent beneath.

Flowers: Orange-yellow or cream-coloured, sessile, borne in axillary foliaceous bristle-tipped bracts.

Fruits: Capsules ovoid, $1.8-2.5 \mathrm{~cm}$ long with a tapering beak, 2-seeded.

Seeds: Compressed, ovate, clothed with silky appressed hairs.

## Bergia ammannioides Hayne ex Roth.

## Common Name : Jerry water-fire <br> Family : Elatinaceae

| Habit: | Annual, 8-35 cm tall, erect or somewhat <br> decumbent, branched herb of moist places. <br> Stem: |
| :--- | :--- |
| Stem and branches mostly pinkish, glandular <br> pubescent, rarely sub-glabrous. <br> Opposite, subsessile or shortly petiolate, <br> oblong-obovate, elliptic oblong, lanceolate or <br> oblanceolate, 4-25 mm long, 2-15 mm broad, <br> apex acute, margin minutely and distinctly <br> serrate, glandular pubescent or almost <br> glabrous. |  |
| Flowers: |  |
| Inflorescencedenseorlooseaxillary fasciculate |  |
| cymeof 6-12or moreflowers. Flowers reddish. |  |
| Fruits: | Capsulereddish, ovoid or subglobose, margins <br> ofthevalvesincurved. |
| Seeds: | Seeds minute, with rounded ends, dark brown, <br> shining, somewhatreticulate. |

## Bergia capensis L.

## Common Name : Cape ash <br> Family : Elatinaceae

Habit: Herbsannual, 15-30 cmtall.

Stem: Prostrate and rooting in lower part, terete, slightly fleshy, glabrous; branches erect.

Leaves: Leaf blade elliptic-lanceolate, obovatelanceolate, or obovate, $1-4 \times 0.2-1 \mathrm{~cm}$, papery, base acuminate, margin minutely serrulate or subentire, apex acuteor attenuate.

Flowers: Flowers arranged into small, axillary cymes, subsessile or with short pedicel 1-5 mm, very small, pink.

Fruits: Capsule subglobose, 1.8 mm in diameter, longitudinally 5-grooved, 5-septicidal.

Seeds: Oblong, minute, angular or transversely striate.

## Bidens pilosa L.

| Common N ame | : Spanish needles |
| :--- | :--- |
| Family | $:$ Asteraceae |

Habit: An erect, simple or much- branched annual or perennial herb, $60-90 \mathrm{~cm}$ tall.

Stem: Glabrous or more or less pubescent, quadrangular, grooved; branchesopposite.

Leaves: Very variable, sometimes trifoliate, but usually consisting of 2 sub oppositepairs of leaflets and alarger, deeply 3-lobed, terminal leaflets.

Flowers: The inflorescence is an isolated or grouped pedunculated capitula, emerging from the leaf axil. Heads borne singly at the ends of long, slender, nearly leafless branches; narrow, discoid, the disk 4-6 mm wide at anthesis; ray florets white or pale-yellow and disk florets yellow.

Fruits: Achenes 0.8-1.7 cm long, linear, quadrangular, slightly tapering towards the apex, black, glabrous, bearing a few pale stiff hairs on the angles in the upper part; pappus bristles 2-4,
 straw-coloured, 2-3mmlong.

## Biophytum sensitivum (L.) D on.

## Common Name : Life plant Family <br> : Oxalidaceae

Habit: An annual herb, up to 25 cm tall.
Stem: Slender, erectwith a rosetteof leaves atop.
Leaves: Sensitive to touch, pinnately compound. Crowded into a rosette atop the stem, 3.8-12.7 cm long, leaflets 3-12 pairs, opposite, oblong, theterminal pair isthelargest.

Flowers: Dimorphic, yellow, 0.8 cm across, on peduncles of varying lengthsup to 10 cm .

Fruits: Capsules globose or elliptic, shining, 5-valved, approximately 3.5 mm long.

Seeds: Minute with obliquely transverse tubercled
 ridges.

## Blainvillea acmella (L.) Philipson.

## Common Name : Para cress flower Family

Habit: Anerectherb, 0.3-1.2mhigh.
Stem: Much branched, bristly-hairy.
Leaves: Elliptic to ovate, up to 12 cm long, 8 cm wide, base wedge-shaped, margins serrate-crenate, tip sharp, 3-veined from base, bristly-hairy.

Flowers: Flower heads are slightly elongated, bellshaped. Ray florets are whitish, 35 in number, irregularly 3 -parted, $10-12 \mathrm{~mm}$ long. Disc floretswhitish, 5 -parted, $3-4 \mathrm{~mm}$ long.

Fruits: Achenes are narrowly obovoid, 35 mm long, pappus of weak bristlesup to 1 mmlong, on the edgeof ashallow cup.

## Blepharis maderaspatensis (L.) Roth.

## Common Name : Creeping Blepharis Family : Acanthaceae

Habit: A small pubescentherb.
Stem: Wiry prostratestems, rooting at thenodes.
Leaves: Leaves in whorls of 4, unequal-sided, elliptic to obovate, $2.5-5 \mathrm{~cm}$ long.

Flowers: White, pink or pale blue with a yellow spot on thelower lip, borne sol itary or in clusters of 2-3 in leaf axils, surrounded by whitemembranous bracts with green veins, the apical margins of which arefurnished with hairy bristles.

Fruits: Anovoid capsule, 0.6-0.8cmlong, 2-seeded.

## Blumea lacera (Burm.f) D C.

## Common Name : M alay blumea Family : Asteraceae

Habit: An erect, glandular, annual herb with a strong odor.

Stem : Simpleor branched, hairy, very leafy and 1-2 ft in height.

Leaves: Obovate or oblanceolate, 5-12 cm long, 2-6 cm wide, smaller towards the top, stalked, and toothed or (rarely) lobulated at themargins.

Flowers: The bright yellow flowering heads are about 8 mm across, borne on short axillary cymes, and collected interminal, spike-likepanicles.

Fruits: The achenes are not ribbed, somewhat 4angled and smooth.

## Blumea oxyodonta DC.

## Common Name : Spiny leaved blumea Family : Asteraceae

H abit: Perennial herb, 15-40 cmhigh.
Stem: Stems usually numerous, prostrate or ascending, finely pubescent.

Leaves: Sessile, elliptic to obovate, 1-5 $\times 0.5-1.5 \mathrm{~cm}$, both surfaces sparsely to densely villous and stipitate glandular, base cuneate, margin with afew sharp subspinoseteeth, apexacute.

Flowers: Capitula few in terminal and axillary panicles; yellow.

Fruits: Achenes white, unribbed, 0.6 mm long; pappus white, $3-4 \mathrm{~mm}$.

## Blumea wightiana DC.

## Common Name : Soft blumea Family

Habit: An aromaticherb, growing up to 80 cm tall.
Stem: Eerect, simple or branched from the base, glandular-hairy.

Leaves: Ovate-oblong, 1-9.5 cm long, $0.6-5 \mathrm{~cm}$ wide, sharply toothed, densely silky hairy on both surfaces, upper leaves smaller, acute to apiculate, base acute, sessile, lower leaves rounded or obtuse, basetapering, petiolate.

Flowers: Rose to pink flowers are borne in dense flattopped clusters. Flower-heads arebell-shaped.

Fruits: Achenes oblong, 0.5 mm long, sparsely to densely hairy; pappuswhite, 2-4mmlong.

## Boerhavia diffusa L.

## Common Name : Red spiderling <br> Family : Nyctaginaceae

H abit: A very variable, diffusely branched, pubescent or glabrous, prostrateherb.

Stem: Creeping, often purplish, swollen at the nodes, up to 1.2 m long with a stout woody rootstock.

Leaves: Long-petioled, ovate or oblong-cordate, entire or sinuate, usually whitish and smooth beneath and rough green on upper surface.

Flowers: Flowers red, pink or white, borne in small umbels arranged in axillary and terminal panicles.

Fruits: Ovate, oblong, 1.3 cm long, five-ribbed, pubescent, viscid, glandular.

## Boerhavia erecta L.

## Common Name : Erect spiderling Family : Nyctaginaceae

| H abit: | Perennial, erectherb, up to 1 mtall. |
| :--- | :--- |
| Stem: | Terete, thickened at nodes, green or purple, <br> commonly sticky. |
| Leaves:Leaves in unequal pairs, petiolate, glandular, <br> finely hairy, $10-40 \times 5 \times-25 \mathrm{~mm}$ (larger leaves), <br> and 5-30 4420 mm (smaller leaves). |  |
| Flowers:Inflorescence of axillary and terminal panicles, <br> or umbel-like, with 3-9 flowers per group; <br> flowerswhiteto pink. |  |
| Fruits: $\quad$4 mm long, thin-walled, ribbed, becoming <br> sticky whenwet. |  |
| Seeds: $\quad$Club-shaped, longitudinally-ribbed. |  |

## Borreria hispida (L.) K. Schum.

## Common Name : Shaggy buttonweed Family : Rubiaceae

Habit: A procumbentherbwith astouttaproot.
Stem: Quadrangular, hirsute, hispid or subglabrous, usually with long internodes.

Leaves: Leaves subsessile, $1.3-5 \mathrm{~cm}$ long and $0.8-2 \mathrm{~cm}$ wide, oblong or elliptic, apex acute, scabrid, pubescent or nearly glabrous with scabrid or ciliatemargins.

Flowers: Blue, pale mauve or white, 4-6 together in a whorl within astipular cup.

Fruits: Capsules 5 mm long, hard, usually hairy, ellipsoid, rounded at both ends.

Seeds: $\quad 3-4 \mathrm{~mm}$ long, oblong or ovoid, ventrally grooved, granulate, brown.

## Borreria pusilla (Wall.) DC.

## Common Name : Tiny false buttonweed Family : Rubiaceae

H abit: A nnual herb, 5-20 cmtall.
Stem: Mostly unbranched, quadrangular, angles scabrid.

Leaves: Oppositeand verticillate, $2-5 \times 0.5-0.7 \mathrm{~cm}$ linear or narrowly elliptic, more or less sessile, acute and attenuate, margin and midrib beneath scabrid, with 2-3pairs of lateral nerves.

Flowers: Inflorescence axillary with dense globose heads, 5-10 mm in diameter; flowerswhite.

Fruits: Capsule 2-2.5 mm long, narrowed at base, pubescentabove, glabrousbelow.

Seeds: Polished, shining, 1.75-2×0.7mm.

## Brachiaria deflexa (Schumach.) Robyns

## Common Name : Annual brachiaria <br> Family : Poaceae

H abit: Tufted annual, $15-125 \mathrm{~cm}$ high.
Stem: Weak, ascending, culms.
Leaves: Leaf-blades flat, $4-25 \mathrm{~cm}$ long and $4-22 \mathrm{~mm}$ wide, rounded to thebase.

Flowers: Inflorescence a false panicle of 4-24 often compound racemes on an axis, $5-18.5 \mathrm{~cm}$ long, racemes 2-10 cm in length with a triquetrous rhachis.

Fruits: Spikelets pedicelled, borne in pairs, one of a pair on a longer pedicel (up to 15 mm long) than the other; spikelets broadly elliptic, glabrous to pubescent 2.5-3.5 mm long with a shortstipeup to 0.5 mm long.

## Brachiaria erusiformis (J.E.Smith) G riseb.

## Common Name : Sweet signal grass Family

Habit: Annual grass.

Stem: Spreading culms rooting at the lower nodes. Flowering culmsup to 45 cm high.

Leaves: Bladesslightly hairy, flat, usually less than 7 cm long and only up to 4.5 mm wide.

Flowers: Panicle 5-7 cm long with several appressed to ascending racemes up to 2.3 cm long; rachis pubescent.

Fruits: $\quad$ Spikelets about 2.5 mm long, slightly hairy.

## Brachiaria ramosa (L.) Stapf.

## Common Name : Browntop millet. Family : Poaceae

Habit: Annual, mostly $10-70 \mathrm{~cm}$ tall.
Stem: Angular, ribbed, thickened above the node, moreor lessdensely hairy.

Leaves: Flat, lanceolate leaf-blades 2-25 cm long and 425 mm wide.

Flowers: Inflorescence of 3-25 racemes on an axis, 3-10 cm long. Racemes, $1-10 \mathrm{~cm}$ in length, the longer ones branched, bearing paired short pedicelled spikeletson atriquetrousrhachis.

Fruits: Spikelets elliptic, 2.5-3.5 mm long, acute to cuspidate.

## Brachiaria reptans G ard. \& Hubb.

## Common Name : Running grass Family : Poaceae

Habit: Annual grass.
Stem: Usually with decumbent stems, rooting at the nodes; culms $15-60 \mathrm{~cm}$ high.

Leaves: Leaf-blades narrowly lanceolate to lanceolate, 2-7cm long, 3-15mmwide.

Flowers: Inflorescence of 5-15 racemes on an axis, 1-8cm long; racemes 14 cm long, bearing paired spikelets crowded on a triquetrous rhachis with hirsutepedicels.

Fruits: Spikelets narrowly ovate to broadly elliptic, 1.5-2.2 mm long, glabrous, acute, without a stipe.

## Cabomba aquatica (Piotr Kuczynski)

| Common Name | : Yellow cabomba |
| :--- | :--- |
| Family | : Cabombaceae |

H abit: Submersed and floating-leaved aquatic plant.
Stem: Stemsemergeatintervalsfrom slender roots.
Leaves: Lamina of the floating leaves peltate, broadly elliptic to ovate, margins entire. Divisions of submerged leaves three-dimentionally ramifid, non-planar, terminal divisionsnarrow and linear. Young floating leaves raised 0.5 cm abovesurfaceof water by thick petiole

Flowers: Solitary, raised above the water surface on a long pedicel;yellow

## Caesulia axillaries Roxb.

## Common Name : Pink node flower <br> Family : Asteraceae

Habit: Glabrous, erector decumbentherb.

Stem: $\quad 15-45 \mathrm{~cm}$ tall.

Leaves: 5-15 cm long, lanceolate-oblong or narrowly lanceolate, semi-amplexicaul.

Flowers: Paleblue, lilac or white in globose, compound heads.

Fruits: Achenes obovoid, dark brown, ribbed, flattened.

## Calotropis gigantea (L.) Aiton.

Common Name : Crown flower<br>Family : Asclepiadaceae

H abit: Largeshrub, which lookslikeasmall tree; up to 5mtall.

Stem: Woody with yellowish-white bark. Young stems and branches covered with soft, loosely appressed, whitish, waxy or some times powdery pubescence.

Leaves: Fleshy, obovateor obovate-oblong, apex acute, rarely rounded, basecordate, $6-20 \mathrm{~cm}$ long and $3-8 \mathrm{~cm}$ wide, glaucous green, smooth above, cottony below.

Flowers: $14-15 \mathrm{~mm}$ long and $3-4.5 \mathrm{~cm}$ in diameter; clusters of waxy flowers that areeither whiteor lavender in colour. Each flower consists of five pointed petals and a small, elegant "crown" rising fromthecentre.

Fruits: A follicle.
Seeds: Broadly ovate, flattened, brown in color 2.5-3.2 cm long including the white tuft of hairs at the pointed end.

## Calotropis procera (A iton) D ryand. ex.

## Common Name : Swallo-wort <br> Family : Asclepiadaceae

Habit: A hardy, erect, pubescent evergreen shrub.
Stem: Angular, ribbed, thickened above the node, moreor less densely hairy.

Leaves: Leaves subsessile, broadly ovate, ovateoblong, elliptic or abovate, acuteor mucronate, slightly cordate and auricled at base, cottonypubescent when young, glabrous when fullgrown, $5-23 \mathrm{~cm}$ long and $4-9 \mathrm{~cm}$ wide, pale green above, whitetawny beneath.

Flowers: Whiteto pink, tinged with purple.
Fruits: Follicle subglobose, ellipsoid or ovoid, recurved, generally $10-14 \mathrm{~cm}$ long.

Seeds: Numerous, ovoid, acute narrowly margined, light brown, with a white tuft of silky hair (coma) at thepointed end.

## Cannabis sativa L.

## Common Name : Hemp Family : Cannabaceae

H abit: Annual herb, usually erect; up to 5 mtall .
Stem: Stems variable, with resinous pubescence, angular, sometimes hollow.

Leaves: Basal leaves opposite, the upper leaves alternate, stipulate, long petiolate, palmate, with 3-11, rarely single, lanceolate, serrate, acuminate leaflets up to 10 cm long, 1.5 cm broad.

Flowers: Flowers monoecious or dioecious, the male in axillary and terminal panicles, apetalous; femaleflowers in theaxils and terminally with 5yellowish petals.

Fruits: A brown, shining achene, variously marked or plain.

## Cardamine hirsuta L.

## Common Name : Hairy bittercress <br> Family : Brassicaceae

Habit: An erect annual or biennial herb, up to 40 cm high.

Stem: Stem arise from basal rosette of leaves; glabrous, green or sometimes purplish.

Leaves: Leaf has about5-7roundish, sometimesstalked leaflets on each sideand alarger oneat theend.

Flowers: Occurs in clusters at the end of the flowering stem; small, white.

Fruits: Siliqua noticeably overtop the unopened flowers; narrow, compressed.

## Cardiospermum halicacabum L.

Common Name : Balloonvine<br>Family : Sapindaceae

Habit: An annual or sometimes perennial climber.
Stem: Pubescent.

Leaves: Leaves alternate, deltoid, biternate, 3-8 cm long, petioles 2-3.8 cm long; leaflets deeply dentate or lobed, acuminate, lateral leaflets oblong or ovate, terminal leaflets rhomboidlanceolate.

Flowers: Flowers white, 3-4 mm long, in few-flowered umbellate cymes, with a pair of peduncles modified into tendrils.

Fruits: Capsules depressed-pyriform, 3-valved, covered with bladder-like calyx, winged at the angles.

Seeds: Globose, black, smooth, 4-6 mm in diameter, with a small white, heart-shaped aril.

## Cassia absus L.

## Common Name : Pig's senna <br> Family : Fabaceae

| H abit: | Anerect annual herb. |
| :--- | :--- |
| Stem: | $15-60 \mathrm{~cm}$ tall, stems and branches covered with <br> grey, bristly, viscous hairs. |
| Leaves: $\quad$Leaves paripinnate; rachis bearing a linear <br> gland between leaflets of one or both pairs; <br> leaflets 2 pairs, membranous, 1.6-4cm long and <br> $0.8-2.5 \mathrm{~cm}$ wide (the terminal pair the largest), <br> elliptic to elliptic-obovate, apex rounded, base <br> asymmetrical. |  |
| Flowers:Yellow or reddish-yellow, borne in narrow <br> leaf-opposed, few-flowered racemes, 2-13 cm <br> long. |  |
| Fruits: $\quad$Pods compressed, thin, linear oblong, 2.5-4.5 <br> cm long, clothed with bristly hairs, elastically <br> dehiscent. |  |
| Seeds:5-8 per pod, obovate or rhombic, dark brown, <br> shining. |  |

## Cassia mimosoides L.

## Common Name : Feather-leaved cassia Family : Fabaceae

H abit: A diffuse, erect, annual or perennial herb.
Stem: Up to $1 m h i g h$, pubescent.
Leaves: Leaves 4-10 cm long, with a concavegland just below the lowest pair of leaflets; upper surface of rachis usually serrate-or crenatebetween the leaflets; leaflets generally 30-50 pairs, crowded, overlapping, linear-oblong, rigidly coriaceous, 2-9 mm long and 0.5-2 mm wide, apex acute, mucronate.

Flowers: Yellow, solitary or in groups of 2-3, axillary.
Fruits: Pods flat, linear or linear-oblong, moderately pubescent, dehiscent, about 3.5 cm long and 0.6 cmwide.

Seeds: Brown, rhombic, 2-4 mm long and 1-2 mm wide.

## Cassia occidentalis (L.) Link.

Common Name : Coffee senna<br>Family : Fabaceae

Habit: Anerect, fetid, woody herb or undershrub.
Stem: $\quad 60-150 \mathrm{~cm}$ tall, smooth, purplish or green.
Leaves: Alternate, pinnate, $15-20 \mathrm{~cm}$ long, stipulate with a sessiledark brown gland near thebaseof the petiole; leaflets 3-5 pairs, opposite, shortstalked, membranous, ovate or Ianceolate, 3-9 cm long and $1.5-4 \mathrm{~cm}$ wide, baserounded, apex acute or attenuate, glabrous above, glaucous beneath.

Flowers: Yellow, in short, few-flowered axillary or terminal racemes.

Fruits: Pods recurved, glabrous, compressed, 10-13 cm long and 0.8 cm wide.

Seeds: Dark olive-green, ovoid, compressed, smooth, hard, shiny seeds, 6 mm long and 4 mm wide.

## Cassia pumila Lam.

## Common Name : D warf cassia <br> Family : Fabaceae

H abit: A prostrate, suberect or erect herb.
Stem: Numerous, spreading, 30 cm long; branches slender, clothed with whitehairs.

Leaves: Leaves 2-5 cm long, rachis hairy, common petiole $3-4 \mathrm{~mm}$ long with a stalked gland on the petiole below; leaflets $10-20$ pairs, $6-13 \mathrm{~mm}$ long and 2.5-3 mm wide, linear-oblong, very unequal-sided, apex rounded and apiculate, nerves conspicuous beneath.

Flowers: Yellow, usually solitary or 2-3 together, supraaxillary; pedicelsvery shortand slender.

Fruits: Pods $2.5-3.8 \mathrm{~cm}$ long and $0.4-0.5 \mathrm{~cm}$ wide, with oblique partitions between the seeds, linear, flat, glabrousor with afew scattered hairs.

Seeds: Brown, obovoid-cuneate, compressed, rectangular, shiny.

## Cassia tora (L.) Roxb.

## Common Name : Sicklepod <br> Family <br> : Fabaceae

Habit: A fetid, annual herbor undershrub.
Stem: $\quad 0.3-1 \mathrm{mtall}$ with glabrous branches.
Leaves: Leaves 6-12.5 cm long; leaflets in 2-4 opposite pairs with a conical gland between each of the two lowest pairs of leaflets; blades $1.5-5 \mathrm{~cm}$ long and $1.5-2.5 \mathrm{~cm}$ wide, membranous, ovateoblong, apex acute to subacute, often mucronate, base acute to asymmetrically rounded.

Flowers: Usually in pairs, on very short axillary peduncle; paleyellow, upper petal 2-lobed and theothersentire.

Fruits: Podsstout, 4-angled, $15-25 \mathrm{~cm}$ long, containing 25-30seeds.

Seeds: $\quad 4-5 \mathrm{~mm}$ long, rhomboidal, yellowish brown to

## Catharanthus pusillus (M urr.) G. D on.

## Common Name : Tiny periwinkle Family : Apocynaceae

| H abit: | Anerect, glabrousannual herb. |
| :--- | :--- |
| Stem: | Up to 60 cm tall, much branched with 4-angled <br> branches. |
| Leaves: | Leaves Ianceol ate, 2-7 cm long and $0.5-2 \mathrm{~cm}$ <br> wide, apex acuminate; petioles $1.5-5 \mathrm{~mm}$ long. |
| Flowers: | Solitary or in pairs, white. |
| Fruits: | Small, divaricate, membranous follicles, in <br> pairs. |
| Seeds: | Subcylindrical, black and ribbed. |

## Cayratia trifolia (L.) Domin.

## Common Name : Bush Grape <br> Family : Vitaceae

Habit: A perennial climber.
Stem: Up to 7 m long and 4.5 cm in diameter; stems woody at thebaseonly.

Leaves: Alternate, trifoliate; tendrils slender, leafopposed; leaflets thick, generally $3.8-5.7 \mathrm{~cm}$ long and 2.2-3.2 cm wide, ovate-lanceolate to obovate or rotund-ovate, apex acute, mucronate, base rounded, obtuse or acute, margins crenate to serrate, more or less pubescent on both surfaces.

Flowers: Bornein branched, divaricate, pubescent, longpeduncled, axillary or terminal cymes, up to 8 cm long and broad.

Fruits: Berries white, globoseor turbinate, fleshy, 1.2-2 cm long, 2-4seeded.

Seeds: Triangular, rounded and rugose on the back, cuneateon theface.

## Celosia argentea L.

## Common Name : Cock's comb <br> Family : Amaranthaceae

Habit: Anerectannual herb.
Stem: Up to 1 m tall with angular stems and grooved branched.

Leaves: Linear-lanceolate to elliptic-lanceolate, acuminate, narrowed at the base, entire, up to 12 cm long and 4 cm wide.

Flowers: White or pink, glistening, borne in feathery, conical to cylindrical spikes.

Fruits: Membranousutricle.
Seeds: $\quad 1.3-1.5 \mathrm{~mm}$ long, $1.0-1.2 \mathrm{~mm}$ wide, glossy black, slightly reticulate.

## Centella asiatica L.

## Common Name : Asiatic pennywort <br> Family : Apiaceae

H abit: Perennial herb.
Stem: Prostrate, slender, creeping with long stolans and nearly glabrous or hairy on young parts.

Leaves: Cordate or hastate or orbicular or reniform or sub entire or palmately lobed consisting of long petiole and small stipules. Leaf blades are dentate, crenate with thick radiate veins and dark green in col or. Leaves areglabrous on both surfaces.

Flowers: Inflorescencesimpleumbel of 3-6flowersat the ends of slender peduncles arising from the axils of leaves and much shorter than petioles supported below by an involucre of 2-boat shaped membranous persistent bracts. Flowers aresmall, sessileand dark pink in color.

Fruits: Carpels oblong, sub-cylindric, curved and less in length, much laterally compressed, readily separating into 2 indehiscent halves (mericarps) united by a very narrow planeof junction.

## Centrosema pubescens Benth.

## Common Name : Butterfly pea. <br> Family : Fabaceae

Habit: Vigorous, trailing, twining and climbing perennial herb.

Stem: Very leafy and slightly hairy.
Leaves: Trifoliate; leaflets dark green elliptic or ovateelliptic, obtuse or shortly obtusely acuminate, about $4 \times 3.5 \mathrm{~cm}$, slightly hairy, especially on thelower surface. Stipuleslong, persistent.

Flowers: Large and showy, borne in axillary racemes. Each flower has two striate bracteol es. Flowers bright or pale lilac on either side of a median greenish-yellow band with numerous dark violet stripes or blotches.

Fruits: Pod linear with prominent margins, 7.5 to 15 cm long, flat, thick, straight or slightly twisted, acuminate, dark brown when ripe, containing
 up to 20 seeds.

Seeds: Shortly oblong to squarish with rounded corners, $4-5 \times 3-4 \mathrm{~mm}$, brownish-black, mottled darker blotches.

## Chenopodium album L.

## Common Name : Common Iambsquarter Family : Chenopodiaceae

Habit: A polymorphous, non-aromatic, erect herb.
Stem: $\quad 0.3-3 \mathrm{~m}$ tall with angled stems that are often striped green, red or purple, clammy to the touch.

Leaves: Leaves very variable in size and shape, rhomboid, deltoid to lanceolate, upper leaves entire, lower ones toothed or irregularly lobes, $10-15 \mathrm{~cm}$ long, with petioles often as long as leaf blades.

Flowers: Green, borne in clusters forming a compact or loosely panicled axillary spike.

Fruits: Utricle.
Seeds: Round, compressed, black and shining.

## Chenopodium murale L.

## Common Name : Nettle-leaved goosefoot <br> Family : Chenopodiaceae

Habit: A n erect or prostrateand ascending, bushy, rather stout, herbaceous annual, up to 90 cmhigh .

Stem: Usually branched from the base, branches ascending; glabrous to sparsely farinose. stems occasionally red-striped.

Leaves: Alternate along the stems, dark green; 1-10 cm long, $1-5.5 \mathrm{~cm}$ wide, deltoid to rhombic-ovate, apex acute or obtuse, base cuneate to truncate or subcordate, margins coarsely and irregularly sinuate-dentateor laciniate.

Flowers: Flowers in small glomerules, in lax or dense axillary and terminal, short, cymose panicles, some arising from the lower leaf axils. Flower clusters covered with a mealy substance.

Fruits: Utricle with membranous pericarp; pericarp adherentto seed.

Seeds: Horizontal, tiny, about 1.5 mm in diameter, lens-shaped/disk-shaped, margins acute with conspicuous thin rim, dull black, surface finely, shallowly puncticulate.

## Chloris barbata Sw.

## Common Name : Purplechloris <br> Family : Poaceae

Habit: A tufted, erect, annual or short-lived perennial grass.

Stem : 0.3-1.0 m or more tall, Iargely glabrous. The erect and branching stems, which are sometimes bent at the base, are smooth and usually flattened. They are purpleor pink at the base, simpleor branched, 3-5-noded, rooting at thelower nodes.

Leaves: The leaf blades are flat and narrow, linearlanceolate, $10-20 \mathrm{~cm}$ long, 2-3 mm wide and usually bluish-green with rough edges. The sheaths aresmooth and $2-6 \mathrm{~cm}$ long; Theliguleis $0.5-1.0 \mathrm{~mm}$ long, membraneous and fringed with shorthairs.

Flowers: A whorl of 5-15 digitate spikes which are densely clustered. The spikes are usually ascending, purple and 5-8 cm long with three-flowered spikelets (one fertile flower). These are purplish and densely overlapping, with three slender awns.

Grain: Pale brown, tapering at both ends and 1-2 mm long, enclosed within the persistent lemma and
 palea.

## Chromolaena odorata L. R.M. king \& H. Rob

| Common Name | : Siam weed |
| :--- | :--- | :--- |
| Family | : A Asteraceae |

Habit: A herbaceous to woody perennial with a bushy habit which forms avery densethicket.

Stem: Up to 2 m tall. Terete and become woody. Twigs are slightly striolate Iongitudinally, pubescent, opposite-decussate.

Leaves: Simple, opposite-decussate and without stipules. They are rhomboid-ovate to ovate with an acute apex and a cuneate base. Theblades are trinerved a few millimetres after the base, roughly crenateserrate beyond their maximum breadth, slightly pubescent above and pubescent with numerous small yellow dots below.

Flowers: Capitula are grouped in 1, 3 or 5 convex trichotomic corymbs, $5-10 \mathrm{~cm}$ in diameter, at the end of thetwigs. Colour ranges from pale-lilac to white.

Fruit: $\quad$ Cypsela is composed of a 3-4-mm-long fusiform blackish achene, with five beige barbelate ribs, overtopped by a pappus of about 30 barbelate
 beigecapillary bristles which are4-5mmlong.

## Chrozophora plicata (Vahl) A. Juss. ex Spreng

Common Name Family<br>: Giradol<br>Euphorbiaceae

## Chrozophora rottleri Klotzsch.

## Common Name : Rottler's chrozophora Family <br> : Euphorbiaceae

Habit: An erect herb, up to 60 cm high.
Stem: Lower partof stem is naked, upper parthairy.
Leaves: Stalked, $3.5-9.5 \mathrm{~cm}$ long, $2.3-8 \mathrm{~cm}$ wide, ovate to circular, with wavy margin. The leaves are densely hairy on both sides.

Flowers: Small, yellowish. Male flower petals ovate. Femaleflower sepals triangular, acute.

Fruit: A capsule.

## Cichorium intybus L.

## Common Name : Chicory Family : Asteraceae

## Cirsium arvense (L.) Scop.

## Common Name <br> : Canada Thistle Family : Asteraceae

Habit: A perennial herb spreading rapidly by horizontal rootswhich giveriseto aerial shoots.

Stem: $\quad 30-150 \mathrm{~cm}$ tall, slender, green, freely branched.
Leaves: Alternate, the base sessile and clasping or shortly decurrent; leaves generally oblong in outline, margin variable from entire to deeply pinnately segmented, spiny.

Flowers: Plants dioecious, all heads of a plant either male or female. Male heads globular, somewhat smaller than the flask-shaped female heads. Florets all tubular, rose-purple to pinkish, less commonly white. Florets of female heads 23-26 mmlong; florets of mal eheads $12-14 \mathrm{~mm}$ long.

Fruit: Achenes $2.5-4 \times 1 \mathrm{~mm}$, straight or slightly curved,
 straw or light-brown. Pappus copious, white, feathery, $20-30 \mathrm{~mm}$ long on matureachenes.

## Cleome chelidonii Linn.

## Common Name : Celandine spider flower Family <br> : Capparidaceae

Habit: Annual herb.

Stem: Basestout, branchletspubescent.
Leaves: Basally 5-7 foliate, apically 3-foliate; leaflets obovate.

Flowers: Rosecolored, in racemes.
Fruit: Capsuleobscurely striate.
Seeds: Small, spirally round, brownto black.

## Cleome gynandra L.

## Common Name : African spider flower Family <br> : Capparidaceae

## Cleome monophylla L.

## Common Name : Spindle pod <br> Family <br> : Capparidaceae

Habit: Anerectstocky annual herb, 60 cm height,
Stem: Branched, pubescent with some hairs glandtipped.

Leaves: 2-7.5 x 0.3-2.5 cm., linear-lanceolate to oblong, acuteor subacute at theapex, rounded or slightly cordate at the base, entire, pubescent on both sideswith hairsoften glandular.

Flowers: Inflorescence a raceme, elongating in fruit; flowerspaleroseormauve.

Fruits: Capsule up to 10 cm . long, narrowly linear, puberulous, straight or slightly curved, narrowed to both ends with up to 6 longitudinal nerves on each valve.

Seeds: Dark brown, 1.8 mm in diameter, radially ridged with the ridges bearing minute puberulous incrustations.

## Cleome viscosa L.

## Common Name : Tick weed <br> Family : Capparidaceae

Habit: An erect, simple or sparsely branched, unarmed annual herb.

Stem: Up to 1.5 m tall with a strong, penetrating and unpleasant odour; stems grooved, densely clothed with glandular or simplehairs.

Leaves: Leaves 3-5 foliate, densely glandular-pubescent when young, petioles of the lower leaves $2.5-5 \mathrm{~cm}$ long, those of the upper leaves $0.4-3.8 \mathrm{~cm}$; leaflets elliptic-oblong or obovate, $2-4.3 \mathrm{~cm}$ long and 0.8 2.5 cm wide, base cuneate to attenuate, apex acute or obtuse.

Flowers: Flowers various shades of yellow or white to pinkish or purple, 1.3 cm long, bornein theaxilsof reduced leaf-like bracts in lax corymbose racemes.

Fruit: A slender, erect, glandular pubescent cylindrical capsule, $5-12 \mathrm{~cm}$ long.

Seeds: About 1 mm in diameter, granular, black or dark
 brown.

## Clerodendron infortunatum $\mathbf{G}$ aertn.

## Common Name : Hill glory bower Family : Verbenaceae

Habit: A shrub.

Stem: Erect, 0.5-4mhigh, with no branches.
Leaves: Simple, opposite; both surfaces sparsely villouspubescent, elliptic, broadly elliptic, ovate or elongate ovate, $3.5-20 \mathrm{~cm}$ wide, $6-25 \mathrm{~cm}$ long, dentate.

Flowers: Inflorescence in terminal, peduncled, fewflowered cyme; flowers white with purplish pink or dull-purplethroat, pubescent.

Fruits: Berry, globose, turned bluish-black or black when ripe, enclosed in thered accrescent fruiting-calyx.

## Clitoria ternatea L.

## Common Name : Asian pigeonwings Family : Fabaceae

Habit: A annual or perennial herb.
Stem: Slender, climbing or suberect.
Leaves: Odd-pinnate, leaf rachis up to 8 cm long; leaflets $5-7,2-5 \mathrm{~cm}$ long and $1.2-3 \mathrm{~cm}$ wide, elliptic, apex obtuse, basecuneateto rounded, obtuseor retuse, glabrous above, pubescent beneath.

Flowers: Flowers ranging in colour from white to deep blue, axillary, solitary; peduncles $0.6-1 \mathrm{~cm}$ long.

Fruits: Pod linear-oblong, flat, 10 cm long and 1 cm wide, sharply beaked, appressed hairy.

## Cocculus hirsutus (L.) Diels.

Common Name : Ink berry<br>Family : Menispermaceae

H abit: A scandent tomentoseclimber.
Stem: Stragglingwith striatebranches.
Leaves: Variable in shape; the lower leaves of the main branches larger, sometimes 3-5-lobed, upper leaves smaller, narrowly to broadly ovate to elliptic; pubescent on both surfaces.

Flowers: Small, unisexual, pale yellow; male with 6 stamens, borne in small axillary panicles; female with 4-6 carpels, borne 2-3 together in axillary clusters.

Fruits: A compressed pea-sized drupe, purplish-black.
Seeds: Circular-coiled, dull-whiteto grey, surfacerough.

## Coix barbata (Roxb.) R. Br.

## Common Name : None <br> Family : Poaceae

Habit: A tall, robust, branching, monoecious perennial grass.

Stem: Culms 0.9-1.9mtall with softly bearded nodes.
Leaves: Linear, usually $15-30 \mathrm{~cm}$ long and $0.6-2.2 \mathrm{~cm}$ wide, apex acuminate, midrib stout, margins scabrid; leaf sheaths long, smooth or hairy; ligule anarrow ridge.

Flowers: Inflorescence a terminal panicle of racemose spikelets on slender peduncle, maleat thetop and femalebelow.

Seeds: Grain enveloped in thickened lower legumes, 5-7 mmlong.

## Coix lacryma-jobi L.

## Common Name : Job's tears Family : Poaceae

H abit: A stout, much-branched annual grass.
Stem: Culms 0.9-1.5 m tall, spreading below, rooting at thelower nodes, internodessmooth, polished.

Leaves: $\quad 10-50 \mathrm{~cm}$ long and $1.5-5 \mathrm{~cm}$ wide, narrowed from a broad cordate baseto an acuminatetip, smooth on both surfaces, margins spinulosely serrate; midrib stout; sheaths long, smooth; ligule a very narrow membrane.

Flowers: Borne in 2.5-6.3 cm long racemes, nodding or drooping from long peduncles; male racemes 1.54 cm long, erect, spikelets mostly paired; female racemes enclosed within a beadlike auricle, which is white to green or bluish, globose, 0.6-1.2 cmlong, hard.

Fruit: Utricle, oblong-cylindric, truncate at apex, rounded at base.

Seeds: Subcylinderic, truncateat apex, reddish brown.

## Commelina benghalensis L.

## Common Name : Tropical spiderwort Family : Commelinaceae

H abit: A creeping or procumbent annual herb, $60-90 \mathrm{~cm}$ long.

Stem : Dichotomously branched with diffuse branches, often rooting at nodes.

Leaves: Leaves 2.5-7.5 cm long and 1.3-3.8 cm wide, ovate or oblong, apex obtuse, base unequal-sided, rounded, cuneate or cordate, sessile or shortpetioled, pubescent or villous on both surfaces.

Flowers: Spathes 1-3 together, funnel-shaped, auricled on one side, pubescent or hirsute; flowers blue, bornein branched cymes.

Fruit: Capsules 0.6 cm long, pyriform, membranous.
Seeds: Oblong, closely pitted.

## Commelina diffusa L.

## Common Name : Climbing dayflower <br> Family <br> : Commelinaceae

Habit: A creepingherb.
Stem: Rootingatthenodes.
Leaves: Sessile, ovate or lanceolate, entire, acuminate, basesub cordate, chartaceous.

Flowers: Blue, 1-3in cymes; spathes complicate.
Fruit: Broadly oblong acuminate.
Seeds: Tuberculate, reticulate, brown.

## Commelina forskaolii Vahl.

| Common Name | : Rat's ear |
| :--- | :--- |
| Family | : Commelinaceae |

H abit: Herbs, annual or perennial, up to 30 cm tall.
Stem: Erectto ascending, mat-forming.
Leaves: Obl ong or lanceol ate-oblong to oblong-elliptic, $1.5-6 \times 0.4-1.1 \mathrm{~cm}$, margins strongly undulate, completely glabrous or adaxially sparsely pilose.

Flowers: Distal cyme usually exserted, 1-flowered; spathes solitary, pedunculate, strongly inflated; flowersblue.

Fruits: Capsules3-locular, 2-valved.
Seeds: Brown, smooth, 2.5 mm long.

## Convolvulus arvensis L .

Common Name : Field bindweed<br>Family : Convolvulaceae

Habit: A herbaceous perennial growing from a very deep root system. Shoots develop from adventitious buds on the deep root system at almostany depth downto 1 m .

Stem: Slender, to 1.5 m long, twining anticlockwise, glabrous or finely pubescent.

Leaves: Alternate, petiolate, variable in shape, Ianceolate or ovate to narrow-oblong, 1.2-5.0 cm long, acute at theapex, entirebutoften hastate-sagittateat the base, glabrous or pubescent with scattered crisped hairs.

Flowers: White or pink, axillary, solitary, peduncles, 2.5-5 cm long, slender with a pair of small linear bracts at theapex from which thepedicels arise; pedicels $3-25 \mathrm{~mm}$ long.

Fruit: Capsules6-8mmin diameter, globose, glabrous.
Seeds: Subtrigonous, dark reddish-brown, glabrous or
 puberulous.

## Convolvulus pluricaulis Choisy.

Common Name<br>: Aloe weed<br>Family : Convolvulaceae

Habit: A slender, procumbentor suberectherb.
Stem: Up to 50 cm long with a woody rootstock.
Leaves: $\quad 1.2-2.5 \mathrm{~cm}$ long, linear-oblong or the upper elliptic, apex obtuse, mucronate, base tapering, villous on both sides, leaf margins slightly hairy, short-petioled.

Flowers: Axillary or on short lateral branches, sessile or short-pedicelled, 1-3 together; pale rose or roseyellow.

Fruits: An ellipsoid or globose capsule, 0.3 cm long, smooth.

Seeds: Brown to black, 5-7 mm, oval, flat to slightly concave on one side, convex on the other side; minutely puberulous.

## Conyza bonariensis (L.) Cronquist.

## Common Name : Asthmaweed <br> Family : Asteraceae

Habit: Erect perennial, $20-75 \mathrm{~cm}$ tall.
Stem: Erect with stiff hairs, branching at the base, decreasingupwards.

Leaves: Narrow, lanceolate, grey to green color, 2-6 cm long, coarsely toothed and covered with fine hairs; upper leaves aresmaller and linear.

Flowers: Inflorescence much branched; capitulum is greater than 2 mm in diameter.

Fruits: Cypsela linear shaped, 1.5 mm long, straw colored, covered in hairs with 16-20, noticeably longer, at thetop thatarewhiteor pink.

## Conyza Canadensis (L.) Cronq.

## Common Name : Canadian horseweed Family : Asteraceae

Habit: An annual herb, up to $1 m$ high.
Stem: Stout central stem unbranched, ridged and covered with long whitehairs.

Leaves: Alternate around the stem, (appearing almost whorled) differ little in length except beneath the inflorescence, creating a columnar effect. Leaves narrowly lanceolate or oblanceolate, with a few teeth towards the outer tip, and fine white hairs along themargins.

Flowers: Several flowering stems appear at the apex, which branches frequently and spread upward and outward, terminating in a multitude of tiny composite flowers. Disc florets yellow and ray floretswhite.

Fruits: Achenes arelight brown and havetuft of whiteor light brown hairs.

## Corchorus aestuans L.

## Common Name : East Indian jew's mallow Family : Tiliaceae

Habit: An erect or spreading, much branched, annual herb, 20-60 cmtall.

Stem : Stem and branches purple, pilose.
Leaves: Lanceolate to ovate, 2-9.5 cm long, 1-5 cm broad, oblique or obtuse at the base, serrate, basal serratures prolonged into setaceous appendages or not.

Flowers: Cyme antiphyllous, very shortly pedunculate, mostly 2, rarely 3-flowered. Flowers golden yellow, 1 cm across.

Fruit: $\quad$ Capsules solitary or paired, with 3 fairly stout wings, $10-25 \mathrm{~mm}$ long, $4-6 \mathrm{~mm}$ in diameter, truncate and terminating in 3, bifid, radiating, 3-7 mm long beaks at apex, 3-loculed, locules transversely septateor aseptate.

Seeds: Blackish-brown, angular, rough, obliquely truncateatboth ends.

## Corchorus capsularis L.

## Common Name : White jute <br> Family : Tiliaceae

H abit: A large, glabrous, annual herb or undershrub.
Stem: Upto3mtall.
Leaves: 3-5 costate, ovate-lanceolate or linear-lanceolate, $5.5-15 \mathrm{~cm}$ long, $1.5-8 \mathrm{~cm}$ broad, acute or acuminate, coarsely serrate, basal serratures backwardly prolonged into setaceous appendages.

Flowers: Yellow, 8-10mmacross, pedicellate.
Fruit: Capsule subglobose-globose, $10-12 \mathrm{~mm}$ in diameter, beakless and depressed at apex, scabrous, ridged, tuberculate or muricate, 5loculed, locules aseptate.

Seeds: Cuneiform,2mmlong, brown, glabrous.

## Corchorus fascicularis L.

## Common Name : Tall wild jute Family : Tiliaceae

H abit: A nnual, sub-erect, 50-60 cm tall herb.
Stem: Woody with scaly bark.
Leaves: 3-costate, elliptic-oblong or lanceolate to narrowly ovate, $1.5-6 \mathrm{~cm}$ long, $0.5-2 \mathrm{~cm}$ broad, glabrous, serrate, basal serratures not prolonged intofiliformappendages, obtuse.

Flowers: Cyme a fascicle of 2-8 flowers, antiphyllous, very shortly pedunculate. Flowers yellow.

Fruits: Capsules 2-8 in each fascicle, sessile, 1-1.5 cm long, with 1-2 mm long entire beak, somewhat triangular, pubescent, 3-loculed.

Seeds: Wedge shaped, 1.5 mm long, angular, black, obliquely truncateat both ends.

## Corchorus olitorius L.

## Common Name : Jew's mallow Family : Tiliaceae

Habit: An erect, subglabrous, annual or biennial herb, up to 2 mtall .

Stem: Basally woody, branched.
Leaves: 3-5 costate, Ianceolate to ovate-lanceolate, 2.2-9 cm long, $1.8-4.2 \mathrm{~cm}$ broad, glabrous except the scattered hairy veins, serrate, basal serratures prolonged into filiform deflexed appendages, acuteor acuminate.

Flowers: Cyme 1 or 2-flowered, antiphyllous, shortly pedunculate. Flowers yellow, 12-15 mm across; subsessile.

Fruit: $\quad$ Capsules 1 or 2 together, 2-7.2 cm long, with 4-5 mm long, entire beak, $4-5 \mathrm{~mm}$ across, 10 -angled, glabrous, 5-loculed, loculestransversely septate.

Seeds: Greenish-black, triangular, ovate, 2 mm long.

## Corchorus trilocularis Auct.

## Common Name : Cotton weed Family : Tiliaceae

H abit: Anerector suberect, annual herb, 30-60 cm tall.
Stem: Stem and branches glabrous.
Leaves: 3-4 costate, oblong-lanceol ate or linear-lanceolate or somewhat elliptic-obovate, $1.5-9 \mathrm{~cm}$ long, 0.6 2.2 cm broad, crenate-serrate, basal serratures prolonged into filiform spreading appendages or not, acute.

Flowers: Cyme 1-4 flowered, antiphyllous, short peduncled. Flowers yellow, 1 cm across, subsessile.

Fruit: $\quad$ Capsules 1-3 together, erect, cylindrical, $1.5-4 \mathrm{~cm}$ long, 2 mm in diameter, not ribbed, glabrous, terminated by 3 spreading bifid tips, 3-loculed, locules aseptate.

Seeds: A ngular, obliquely truncateat both ends, black.

## Coronopus didymus (L.) Sm.

## Common Name : Lesser swine-cress <br> Family : Brassicaceae

Habit: An annual herb.
Stem: Repent, decumbent, or ascending, multiple from the base, radiating from a central point; glabrous, terete, green.

Leaves: Alternate, petiolate, pinnate, $4-5 \mathrm{~cm}$ long, 2 cm broad, glabrous. Divisions of the leaves opposite, lobed or devided again, acute, linear-elliptic to linear oblong.

Flowers: Inflorescence a small raceme, up to 4 cm long, opposite to one of the stem leaves, compact. Flowers minute, greenish.

Fruits: Glabrous, $3-4 \mathrm{~mm}$ broad, 2 mm long, slightly compressed, sub-globose, 2-seeded.

## Crotalaria medicaginea Lam.

## Common Name : Trefoil rattlepod. Family : Fabaceae

Habit: A herbor shrub, prostrateto erect, 1 mtall .
Stem: Slender, branched, appressed silky pubescent; stipulesfiliform, 2-3mm.

Leaves: 3-foliate; leaflets oblanceolate, obovate-oblong, or ovate-oblong, abaxially densely silky pubescent, adaxially glabrescent, base cuneate, apex obtuse, truncateor retuse.

Flowers: Racemes terminal or leaf opposed, many flowered; flowersyellow.

Fruits: Pods globose, 3-5 mm in diameter, slightly exserted beyond the calyx, pubescent, 2-seeded, apex shortly beakled.

Seeds: Subcylinderic, truncateat apex, reddish brown.

## Crotalaria prostrata Rottl. Ex. Willd.

Common Name : Rattlepod<br>Family : Fabaceae

| H abit: | A prostrateannual herb. |
| :--- | :--- |
| Stem: | Branches slender, densely spreading <br> pubescenttowhiteappressed pilose. |
| Leaves: | Simple; petiole very short; leaf blade elliptic to <br> ovateoblong, $1-3 \times 0.5-1 \mathrm{~cm}$, both surfaceswith <br> trichomes, baseoblique, apex obtuse. |
| Flowers: | Racemes terminal or leaf-opposed, 2-8 <br> flowered;flowersyellow. |
| Fruits: | Pod cylindric, 1cmlong, 10-15-seeded. |

## Crotalaria sagittalis L.

## Common Name : Arrowhead rattlebox <br> Family : Fabaceae

Habit: An annual herb, 15-30cm high.
Stem: Lightgreen, terete, hairy.
Leaves: Alternate, 2-6 cm long and about one-third as much across; they are elliptic to oblong, flat, smooth along their margins. Both the upper and lower sides are hairy. The upper surface is medium green, whilethelower surface is graygreen. Each leaf has a single central vein that is prominent. Thepetioles arehairy and short.

Flowers: Racemes of 1-4 flowers are produced oppositely fromsomeof the leaves. Flowers are yellow.

Fruits: Theseed pods are initially light green, but they later turn dark brown or black at maturity. Full-sized seedpods are $2.5-4 \mathrm{~cm}$ long and
 about 1/ 3 as much across; each seedpod contains several seeds.

## Crotalaria verrucosa L.

## Common Name : Blue rattlesnake <br> Family : Fabaceae

Habit: Erectsub-shrub.
Stem: Branchlets4-angled, pubescent.
Leaves: Simple, ovate or broadly rhomboid, entire, obtuse, acute, pubescent, stipules semi-Iunate.

Flowers: Bluish-white, in leaf opposed or terminal racemes.

Fruits: Pods oblong, cylindric, prominently nerved, thinly pubescent, exceeding thecalyx.

## Croton bonplandianum Baill.

## Common Name : Three-leaved caper <br> Family : Euphorbiaceaee

Habit: Herborsubshrub.

Stem: Woody, well branched.
Leaves: Ovate-lanceolate, serrulate, acute, base acute with sessileglands.

Flowers: Unisexual, yellowish green, in spikes; male flower pedicellate, in fascicles; female ones solitary, sessile.

Fruit: Capsule3-lobed with stellatehairs.

## Cyanotis axillaris Roem. \& Schult. F.

## Common Name : Spreading dayflower Family : Commelinaceae

Habit: A branched prostrate or sub-erect, fleshy annual rooting at thenodes.

Stem: Round, pinkish, growing to a length of 1.5 feet or more.

Leaves: Simple, up to 3 inches long, narrowly oblong, acute, alternate and sheathing at their base; sheaths are dilated, clasping the stem, and ciliate with long hairson margins and sides.

Flowers: Blue, in axillary cymoseclusters, partly hidden by theleaf sheaths.

Fruit: Loculicidal capsule, beaked at thetop.
Seeds: Grayish, truncate at basewith small conical point at thetop and pitted.

## Cyanotis cristata (L.) D. Don.

Common Name : Crested cat ears<br>Family : Commelinaceae

Habit: An annual herb, 10--35cmhigh.
Stem: Creeping, often branched.
Leaves: Leaves all cauline; leaf blade oblong, lanceolate, ovate-lanceolate, or narrowly elliptic, 2-8 $\times 0.8-2$ cm , abaxially glabrousor sparsely arachnoid.

Flowers: Cincinni often solitary, terminal or al so axillary if 2together; peduncleabsent or to 9 cm ; bracts 1-1.5 cm. Flowersblueor purple.

Fruits: Capsule columnar, trigonous, 2.5 mm long, hirsutusatapex.

Seeds: Gray-brown, pitted.

## Cyathula prostrat (L.) Blume.

Common Name : Pasture weed<br>Family : Amaranthaceae

Habit: Perennial herbsor undershrubs.

Stem: Angular, ribbed, thickened above the node, more or lessdensely hairy.

Leaves: Opposite; thebladesentire.
Flowers: Clustered on a rachis of a long raceme on short jointed stalks. Perfect flowers in each cluster of 13; sterileflowers reduced to fascicled hooks.

Fruit: Utricle, ellipsoid, thin walled, indehiscent, 1seeded.

## Cynodon dactylon (L.) Pers.

Common Name<br>Family<br>\section*{: Bermuda grass<br><br>: Poaceae}

Habit: Perennial grass.
Stem: The rhizomes are mainly in the top 10 cm of the soil. They spread horizontally for several meters, with nodes at approximately 10 cm intervals, each with 2-3 scale leaves and a single axillary bud. In dense stands, shoots developing from buds on rhizomes or runners tend to beerect and quite short, up to 25 cm high, but develop into prostraterunnersunder lessdenseconditions.

Leaves: Leaf blades are usually dull grey-green, flat, up to 15 cm long and $3-5 \mathrm{~mm}$ wide, tapering to an abrupt point, finely parallel-ribbed on both surfaces, without a conspicuous midrib. Liguleis very short but with a conspicuousfringeof white hairs.

Flowers: Theinflorescenceis supported on aculmup to 25 cm high and consists of a single whorl of 3-7 narrow racemes, each $3-8 \mathrm{~cm}$ long. Spikel ets are 2-2.5 mm long, in two rows, closely appressed to therachis.

## Cyperus brevifolius Rottb.

## Common Name : Mullimbimby couch Family <br> : Cyperaceae

Habit: A slender perennial (living greater than 1 season) sedge, $15-30 \mathrm{~cm}$ high.

Stem: Triangular in cross-section and smooth. Very long, slender, creeping, pink/ brown rhizomes (underground stems) with roots below every stem.

Leaves: Shiny green, 1-2 mm wide and channeled. The leaves are considerably shorter than the stems. Thenamebrevifoliusmeansshort-leaved.

Flowers: Inflorescence or spikelet (flowerhead) is a green and egg-shaped, with around 100 tiny flowers per head. The flowerheads protrude above the plant.

Fruits: Tiny nut with both surfaces being convex. Each nut is pear-shaped to elliptic and yellow-brown
 in colour.

## Cyperus compressus L.

## Common Name : Poorland flatsedge Family : Cyperaceae

Habit: An erect glabrous, caespitose annual (sometimes biannual), $5-75 \mathrm{~cm}$ high. Its roots are tufted, fine and numerous.
Stem: Erect, tufted, slender or rigidulous, glabrous, compressed, trigonous and $0.5-2.0 \mathrm{~mm}$ thick. The base is covered with red-purple, usually entire and non-fibrous, loose, open leaf sheaths.

Leaves: The leaves are as long as or shorter than the stem. They are subcoriaceous, flat, $1.5-4.0 \mathrm{~mm}$, broad, greyish-green, narrowly linear and taper gradually to afineacuminateapex.

Flowers: The inflorescence has umbellate spikes, some of the rays (usually $3-4$ ) are well developed and up to 8 cm long. Thespikelets arestrongly compressed laterally and there are 4.7 in each ultimate condensed umbellate spike. These are $1.5-3.5 \mathrm{~cm}$ long, $3-5 \mathrm{~mm}$ wideand grey-green, streaked with crimson.
Fruits: Nutlets are shortly stipitate, obovioid, broadly triquetrous, $1.5-1.7 \mathrm{~mm}$ long with three prominent angles and three concavesides. They are dark brown or blackish-brown, apiculateand glossy.

## Cyperus difformis L.

## Common Name : Variable flatsedge <br> Family : Cyperaceae

Habit: An annual sedge, sometimes behaving as a perennial, varies in height from $6-80 \mathrm{~cm}$.

Stem: Smooth, triangular, slightly winged and 0.7-3.0 mm thick. The roots are numerous, fibrous and reddish.

Leaves: Smooth, (or slightly scabrid on the midrib and margin), flat, linear, $5-25 \mathrm{~cm}$ long or often twothirds of the plant height, 2-6 mm wide, sometimes reduced to sheaths. Sheaths are tubular, united, green to reddish-brown and without leaf blades at thebase.

Flowers: Inflorescence consists of dense, globose, umbellate heads, simple or compound, $5-15 \mathrm{~mm}$ in diameter, with 10-60 stellately spreading spikelets.

Fruits: $\quad$ Nutlets, $0.6-0.8 \mathrm{~mm}$ long and $0.3-0.4 \mathrm{~mm}$ wide, triangular, obovate-elliptic, yellowish-brown or pale-brown, minutely papillose.

## Cyperus eragrostis Lam.

## Common Name : Pale galingale <br> Family : Cyperaceae

H abit: Tufted perennial, with very short rhizome.
Stem: Culms trigonous, smooth, 25-90 cm high, 2-4 mmdiameter.

Leaves: Slightly septate-nodulose, as long as culms or shorter, 4-8mm wide.

Flowers: Inflorescence simple to decompound with up to 12 primary branches to 12 cm long; digitate clusters 10-50mm diameter.

Fruits: Nut triquetrous, obovoid, about half as long as glume, 1-1.4 mm long, 0.5 mm diameter, dark brown to greyish.

## Cyperus haspan L.

## Common Name : Haspan flatsedge Family <br> : Cyperaceae

Habit: Perennial stoloniferousherb.
Stem: Slender, triquetrous, obscurely winged.
Leaves: Linear, flat, light green.
Flowers: Inflorescence compound; spikelets oblong, clustered ingroups.

Fruit: Nutlets broadly ovate, trigonous, cream yellow.

## Cyperus iria L.

## Common Name : Ricefield flatsedge Family : Cyperaceae

Habit: An annual sedge, sometimes behaving as a perennial. 8to 60 cm high.

Stem: Theculms aretufted, triangular, glabrous, green and $0.6-3.0 \mathrm{~mm}$ thick. The roots are numerous, short and yellowish-red.

Leaves: Linear-lanceolate, usually all shorter than the culm, 1-8 mm wide, flat, and scabrid on the margin and major ribs; leaf sheaths are green to reddish-brown, membraneous and envelope the culmat thebase.

Flowers: Inflorescence is simple or compound, usually open, $1-20 \mathrm{~cm}$ long and $1-20 \mathrm{~cm}$ wide, with groups of spikes which are either sessile or on $0.5-15.0 \mathrm{~cm}$ long peduncles (rays). Spikelets are erect-spreading, crowded, 6-24-flowered, 2-13 mm long, $1.5-2.0 \mathrm{~mm}$ wide, golden to yellowishgreen.

Fruits: Nutlet, $1.0-1.5 \mathrm{~mm}$ long, $0.6-0.7 \mathrm{~mm}$ wide, obovate, triangular in cross section, dark-brown to al most black; thesurfaceis almostsmooth.

## Cyperus kyllingia L.

## Common Name : White head spike sedge Family : Cyperaceae

Habit: Tufted perennial, 5-45cmtall.
Stem: Stems crowded or remote, solid, rather stiff, sharply three-angular, smooth, 1-1.5 mm in diameter.

Leaves: 2-4, well developed, soft to rather stiff, kelled, linear, margins of the upper part scabrous, usually shorter than thestems.

Flowers: Inflorescence terminal, head-like, ovoidglobose to ellipsoid, 8-12 x 6-10 mm; initially purewhite, later rusty brown.

Fruits: Nut biconvex, compressed, oblong to oblongobovate, apiculate, yellow to darkish brown to glossy black, very finely warted, 1.3-1.5 x 0.50.7 mm .

## Cyperus rotundus L.

## Common Name : Purple nutsedge <br> Family : Cyperaceae

Habit: A perennial sedge.
Stem: Hard, fragrant, globose-ovoid tubers, up to 1.2 cm long and $0.3-0.7 \mathrm{~cm}$ in diameter; culms solitary or few together, sparsely tufted, erect, $10-75$ cmtall, 3 -angled at top.

Leaves: Narrowly linear, shorter or longer than stem, $0.4-0.8 \mathrm{~cm}$ wide, dark green above, palebeneath.

Flowers: Inflorescencea simpleor compound umbel, rays 2-8, each up to 7.5 cm long, bearing short spikes of 3-10 spreading, red-brown spikelets.

Fruits: $\quad$ Nuts oblong to ovate-oblong, 3-sided, 1.3-1.5 mmlong and 0.5-0.7 mm wide, maturing brown.

## Cyperus tenuispica L .

## Common Name : Slender spiked sedge Family <br> : Cyperaceae

Habit: Annual, erect, slender, tufted herb.
Stem: Slender, triquetrous, finely ribbed.
Leaves: Flat, linear, acute, scaberulous; sheathsgrey.
Flowers: Inflorescence a compound umbel; spikelets narrowly linear, stellately spreading.

Fruits: Nuts small, subglobose, trigonous, apiculate, purplish.

## Cyperus triceps Rottb.

## Common Name : None <br> Family : Cyperaceae

Habit: An annual or perennial, tufted, erect herb.
Stem: Slender, triquetrous, dark green, incrassate at base.

Leaves: Flat or folded, flaccid, scabrid; sheaths light yellow.

Flowers: Inflorescence capitate, often 3 (rarely 1-5) lobed spikes; central one sub-globose, or oblong, lateral onesglobose.

Fruits: Nuts biconvex, oblong, laterally compressed, apiculate.

## Dactyloctenium aegyptium (L.) Willd

## Common Name : Crowfoot grass <br> Family : Poaceae

Habit: A nnual, very variable, grass, 10-44cmhigh.
Stem: Erect or creeping culms, rooting from the profusely branched nodes.

Leaves: Linear, tapering to a fine point, 2-10 cm long and $0.2-0.4 \mathrm{~cm}$ wide, flat, glaucous, glabrous or hispid; leaf sheaths striate, the lower whitish; ligules membranous, very short.

Flowers: Inflorescence comprised of 2-6 digitate spikes, $0.5-4 \mathrm{~cm}$ long, olive-grey; spikelets 2-5 flowered, spreading at right angles, pendulous, strongly striate.

Fruits: Grain 0.5-1 mmlong, subglobose, reddish, very rugose.

## D actyloctenium scindicum Boiss.

Common Name : None<br>Family : Poaceae

| H abit: | Stoloniferousperennial grass, $7-45 \mathrm{~cm}$ high. |
| :--- | :--- |
| Stem: | Mat forming, with erect, slender culms from <br> theswollen base. |
| Leaves: | Leaf-blades flat or folded, 1-11 cm long, 1.5-3 <br> mmwide, hispid with tuberclebased hairs. |
| Flowers: $\quad$Inflorescence of 3-5 spikes, each $0.8-2 \mathrm{~cm}$ long <br> in acompacthead. |  |
| Fruits: | Grain 0.7-1 mmlong, transversely rugose. |

## Datura metel L.

## Common Name : Thorn apple <br> Family : Solanaceae

## Desmodium gangeticum (L.) DC

Common Name : Sal leaved desmodium<br>Family : Fabaceae

H abit: A common undershrub, usually 0.6-1.2 mtall.
Stem: Simple, straight, irregularly angled; branches densely hairy.

Leaves: Unifoliate; leaflets membranous, broadly elliptic to ovateor sometimes lanceol ate, 9-12.5 cm long and $3.5-6.3 \mathrm{~cm}$ wide, base rounded or acute, apex acute or acuminate, margins somewhat wavy, usual ly glabrescent on upper surface, pale green and clothed with soft whitish appressed hairs beneath.

Flowers: Flowers violet or white, borne in fascicles of 2-5 flowers in Iax, 40-60-floewered, terminal and axillary racemes, $15-30 \mathrm{~cm}$ long.

Fruits: Pod linear to slightly curved, 1.2-2 cm long and 2 mm wide; joints 4-8, reticulate, longer than broad, indehiscent, sparsely clothed with minutehooked hairs.

## Desmodium laxiflorum DC.

## Common Name : Loose flowered desmodium Family : Fabaceae

Habit: Anerectherb or undershrub, up to 1.2 mtall .
Stem: With quadrangular, appressed-pubescent branches.

Leaves: Alternate, trifoliate; leaflets ovate-elliptic, apex acute to acuminate, silky- pubescent beneath, membranous, up to 14 cm long and 8 cm wide.

Flowers: Flowers 2-5 per bract, borne on $25-40 \mathrm{~cm}$ long racemes; standard white, other petals blue, both covered with yellowish-whitehairs.

Fruits: $\quad$ Pods linear with straight sutures, $2.5-3.8 \mathrm{~cm}$ long and lessthan half as wide, joints 6-10, with hooked hairs.

## Desmodium triflorum (L.) DC.

## Common Name : Three flowered tickerfoil Family : Fabaceae

Habit: A wiry, spreading, perennial herb, up to 0.5 m long.

Stem: With a radial growth habit, often rooting at basal nodes, sparsely pilose.

Leaves: Alternate, trifoliate; leaflets obcordate, emarginated at apex, cuneate at base, margins entire, upper surface glabrous, lower with sparseappressed hairs; terminal leaflet $4-9 \mathrm{~mm}$ long and 3-10mm wide, lateral leafletssmaller.

Flowers: Inflorescence sessile, leaf-opposed fascicles of 2-4flowers; purplish or bluish.

Fruits: Pod linear or oblong, 1-1.5cm long, continuous al ong upper suture, indented on lower suture, with 4-5reti culatejoints, 3-5-seeded.

## Desmostachya bipinnata Stapf.

## Common Name : H alfa grass. <br> Family <br> : Poaceae

H abit: A harsh, rhizomatousperennial grass.
Stem: Stout, up to 1.2 mhigh .
Leaves: Up to 65 cm long, $3.8-10.5 \mathrm{~mm}$ wide when unrolled. Lower leaf-sheaths are leathery, often densely flabellatetowards the base of the culm.

Flowers: Inflorescence is up to 60 cm long. Spikes are clustered or spaced, 14 cm long. Spikelets are317 flowered, narrowly ovate to linear-oblong, 3-10 mm long. Lower glume 0.7-1.5 mm long, upper glume 1.1-2.0 mm long. Lemmas are straw-col oured or suffused with purple, 1.8-2.7 mmlong.

## Dichanthium annulatum (Forsk.) Stapf.

## Common Name : K leberg's bluestem <br> Family : Poaceae

| H abit: | Perennial tussock, sometimes stoloniferous. |
| :--- | :--- |
| Stem: | Culms geniculately ascending; pronounced <br> annulus of radiating, 3-5 mm long white hairs <br> on thenodes. |
| Leaves: | Leaf blade linear, to about 30 cm long and 2-7 <br> mm wide, margins sparsely pubescent and <br> scaberulous. |
| Flowers: $\quad$Inflorescence a sub-digitate panicle, <br> comprising 2-15 pale green or purplish <br> racemes, each 3-7 cm long; geniculate, twisted <br> awn 8-25 mm long, arising from the upper <br> lemmaof thesessilespikelet. |  |
| Fruits: | Caryopsis oblong to obovate, dorsally <br> compressed, 2 mmlong. |

## Digera arvensis Forssk.

## Common Name <br> : False amaranth <br> Family <br> : Amaranthaceae

H abit: An annual herb, 30-60 cm high.
Stem: With spreading branches.
Leaves: Variable, 2-7.5 cm long and $1.3-4.5 \mathrm{~cm}$ wide, ovate or elliptic, acute or rounded at the apex, sometimes with reddish margins, glabrous.

Flowers: Flowers pink, borne in threes in lax, axillary, pedunculatespikes, 2.5-12.5cmlong.

Fruits: Globose, approximately 0.3 cm in diameter.
Seeds: Yellowish-brown.

## Digitaria sanguinalis L.(Scop.)

## Common Name : Large crabgrass Family : Poaceae

Habit: A prostrateor ascending annual grass.
Stem: Prostrate, spreading, branched and rooting at nodes.

Leaves: $\quad 3-20 \mathrm{~cm}$ long, $3-10 \mathrm{~mm}$ wide, with hairs on both the surfaces. Sheaths hairy and closed Leaves and sheaths may turn dark red or maroon with age.

Flowers: Seed head composed of 4-6branches (spikes) at the top of the stems, each approximately 3-15 cmlong.

Fruits: Caryopsis shiny, yellowish-brown, 2-3 mm long.

## Dinebra retroflexa (V ahl.) Panzer.

## Common Name : Viper grass <br> Family : Poaceae

| Habit: | An annual or perennial grass, up 50 cm or <br> moretall. |
| :--- | :--- |
| Stem: | Culms usually straggling from a decumbent <br> base, much branched, rooting at nodes, <br> infrequently erect, green or purplish green. |
| Leaves: | Linear, 2-2.5 x 0.3-0.5 cm, glabrous or thinly <br> pilose, apexacuminate. |
| Flowers: | Inflorescence 6-20 cm long, narrowly elliptic- <br> oblong to pyramidal, open raceme $0.5-4$ cm, <br> stiff, ascending when young, reflexing and <br> finally decumbent from the axis at maturity, <br> rachisflattened, narrowly winged. |
| Fruits: | Spikeletsnarrowly cuneate. |

## Diplocyclos palmatus (L.) C. Jeffrey

## Common Name : Native bryony <br> Family : Cucurbitaceae

H abit: A tuberous, slender annual vine.
Stem: Glabrouswith forked tendrils.

Leaves: Ovate-suborbicular in outline, 7.5-15 cm long, base cordate, blade membranous, scabrid above with minute red scales, smooth or slightly scabrid beneath; lobes lanceol ate, acute to acuminate, margins coarsely, irregularly serrateor sinuateand distantly denticulate.

Flowers: Small, greenish-yellow, the female flowers borneinfascicles, themalesolitary.

Fruits: Berry rounded, $2-3 \mathrm{~cm}$ in diameter, bluishgreen with eight vertical white streaks, ripening red.
Seeds: Brown, obovate, compressed, 4 mm long and 3 mm wide, encircled by a prominent raised band.

## Dyschoriste depressa Nees.

Common Name : D warf snakerherb<br>Family : A canthaceae

## Echinochloa colona (L.) Link.

## Common Name : Jungle rice <br> Family : Poaceae

Habit: An annual grass, 1mor taller.
Stem: Culms stout, erect to decumbent, often branching fromthebase.

Leaves: Sheath glabrous, ligule absent or occasionally represented by a rim of very short hairs, leaf blades glabrous, elongate, $5-15 \mathrm{~mm}$ wide, light green.

Flowers: Panicle erect or nodding, green or purpletinged, $10-20 \mathrm{~cm}$ long. Racemes numerous, 2-4 cm long, spreading, ascending, sometimes branched.

Fruits: Caryopsis ovate, obtuse, usually 2.5-3.5 mm long. Seed white to hyaline with longitudinal ridges on theconvex surface.

## Echinochloa crusgalli (L.) Beauv.

Common Name : Barnyard grass<br>Family : Poaceae

| H abit: | Robust, tufted annual grass, erect or at the base decumbent and rooting at the nodes, $20-150 \mathrm{~cm}$ tall. |
| :---: | :---: |
| Stem: | Culms cylindrical, glabrous, filled with white spongy pith. |
| Leaves: | Leaf sheaths glabrous or the margin or the exposed part of it fimbriate, $9-13 \mathrm{~cm}$ long. Blades merging into the sheath, linear, with a broad, rounded base and acute top; roughmargined, glabrous or at the base with a few long hairs, smooth or the upper surface minutely bristly. |
| Flowers: | Inflorescence an apical panicle of 5-40 spikelike racemes, all turned to one side, with shortly ascending branches, the crowded spikelets at one side only, initially erect, later often bentdown, $5-21 \mathrm{~cm}$ long. |
| Fruits: | Caryopsis ovoid to obovoid, compressed, 1.5-2 mmlong. |

## Echinochloa glabrescens M unro. ex H ook. f.

## Common Name : None <br> Family : Poaceae

Habit: An erect, closely tufted, annual grass, 50-100 cmhigh.

Stem: Culmserect or slightly decumbent at thebase.
Leaves: $\quad$ Sheaths tightly clasping the stem, leaf blades strap-like, $10-20 \mathrm{~cm}$ long, $5-8 \mathrm{~cm}$ wide, with a long, thin apex.

Flowers: Inflorescence a closely branched panicle, 10-20 cmlong.

Fruits: Spikelets numerous, with or without awns (1-3 mmlong, if present).

## Echinops echinatus Roxb.

## Common Name : Indian globethistle Family : Asteraceae

H abit: A rigid, pubescent, annual herb, up to 1 mtall.
Stem: Erect with branches widely spreading from the base.

Leaves: Alternate, sessile, $7.5-12.5 \mathrm{~cm}$ long, oblong, pinnatifid, covered with cottony wool beneath, the lobes triangular and oblong, sinuate and spiny, thespines often 2.5 cm long

Flowers: Flower heads white or purple, compact, globose, $2.5-3.8 \mathrm{~cm}$ in diameter, clustered at the ends of thebranches.

Fruits: Achenes 4 mm long, densely villous; pappus short, yellowish, forming a short cylindrical bush abovetheachene.

## Eclipta alba (L.) Hassk.

Common Name : False daisy<br>Family<br>: A steraceae

Habit: A prostrate, ascending or erect, rough-hairy annual herb, up to 90 cm tall.

Stem: Much-branched, slender, reddish, covered with short, stiff hairs, rooting at thelower nodes.

Leaves: Opposite, simple, rough, dull green, ovate to oblong-lanceolate, 2-10 cm long, 1-3 cm wide, apex acuteor blunt, baseattenuate, margin entire or slightly serrate, pubescent, mostly sessile, the lower leaves sometimes short-petioled.

Flowers: Flower heads up to 1 cm in diameter, a cluster of sessile white flowers, in upper axils or terminal, solitary or two heads together. Ray flowers white.

Fruits: Acheneslight-brown to black, laterally-flattened, wedge-shaped, $2-3 \mathrm{~mm}$ long, 0.9 mm wide. A pex with short, usually white hairs that are easily broken off but two hornlike projections often remain, pappus absent. The rest of the achene is glabrous and covered with many small warts.

## Eichhornia crassipes (M art.) Solms.

## Common Name : Water hyacinth <br> Family <br> : Pontederiaceae

| H abit: | A free-floating or partly rooting perennial <br> aquaticherb. |
| :--- | :--- |
| Stem: | With numerous, long, fibrous roots, shortleafy. |
| Leaves: | In rosettes, spoon or paddle-shaped, apex <br> rounded, $5-20 \mathrm{~cm}$ wide; petioles turbinately <br> swollen and spongy, enabling theplant to float. |
| Flowers: | Mauve, lilac or blue, funnel-shaped, 2.5-3.8 cm <br> Iong. |
| Fruits: | Capsule, many-seeded. |

## Eleusine indica (L.) G aertner.

## Common Name Family <br> : Goosegrass <br> : Poaceae

| H abit: | An annual grass. |
| :--- | :--- |
| Stem: | Erect, slender, flattened, radiating outwards <br> from a central distinctivewhitecenter. |
| Leaves: | 2-14inches long, 3-8mm wide, without hai rsor <br> only sparsely hairy, and folded along the <br> midvein. The ligule is 1-2 mm long, fringed, <br> uneven, and membranous. Sheaths are <br> flattened, whitish at the base, and sparsely <br> hairy in thecollar region. |
| Flowers:Seed heads composed of 2-13 spikes each 1.5 to <br> 6 inches long, 3-7 mm wide, in clusters at the <br> top of stems. Two rows of flattened spikelets <br> occur along each spike. |  |
| Seeds: | Light brownto black, 1-2 mm long. |

## Emilia sonchifolia (L.) DC. Ex Wight.

## Common Name : Red tassel flower <br> Family : Asteraceae

Habit: Annual herbup to 40 cm tall.
Stem: Slender, erector diffuse.
Leaves: Very variable; the lower petioled, lyrate or abovate, toothed or entire; the upper (cauline leaves) more or less emplexicaul and auricled, usually acute.

Flowers: Pink or purplish, borne in solitary or corymbose heads up to 1.3 cm long; peduncles very slender, nodding when young.

Fruits: Achenes 0.3 cm long, narrowly oblong, 5ribbed, brown, scabrid on the ribs, attachment to awhite, softpappus.

## Eragrostis unioloides (Retz.) Nees. Ex Steud

## Common Name : Chinese lovegrass <br> Family : Poaceae

| H abit: | Erector decumbent, annual grass. |
| :--- | :--- |
| Stem: | Solitary or tufted. |
| Leaves: | Opposite, elliptic or obovate, form an acute or <br> obtusebase, acuminateor rounded at apex. |
| Flowers: | Inflorescence an oblong panicle, 10 cm long, <br> spikelets two flowered, ovate-oblong, <br> extremely compressed, purplish-red when <br> mature. 4-7 mm long, the florets closely <br> imbricate. |
| Fruits: | Caryopsis compressed, ellipsoid, about 0.8 <br> mmlong. |

## Eriocaulon sieboldianum Siebold \& Zucc. ex Steud.

Common Name : None<br>Family : Eriocaulaceae

## Euphorbia dracunculoides Lam.

## Common Name : Dragon spurge <br> Family : Euphorbiaceae

H abit: A nnual or short-lived perennial, 10-40 cmtall.
Stem: Slender, sometimes branched basally, 3-7 mm thick, branches ascending.

Leaves: Linear-oblong, $1-3 \mathrm{~cm} \times 2.5-4 \mathrm{~mm}$, base truncate or subattenuate below, rounded higher up, margin entire, apex rounded or obtuse.

Flowers: Cyathium sessile; Male flowers many, not exserted from involucre. Female flower ovary exserted fromcup, smooth, glabrous.

Fruits: Capsule subglobose, $3.5 \times 3.5 \mathrm{~mm}$, smooth or obscurely reticulate, glabrous.

Seeds: Ovoid- terete, $2.5 \times 1.5-2 \mathrm{~mm}$, gray or dark gray, adaxially striate; caruncle present, stipitate.

## Euphorbia geniculata Orteg.

## Common Name : Wild poinsettia <br> Family : Euphorbiaceae

H abit: Erect, annual herb, up to 1.2 mtall .
Stem: Fistular, ribbed, branched in the upper part, glabrous or thinly hairy towards the apex, greenish or purplish in appearance.

Leaves: Alternate below, opposite above, broadly ovate, elliptic, obovate, or panduriform, rarely linear, blades $4-12 \mathrm{~cm}$ long, $0.3-7 \mathrm{~cm}$ wide, glabrous or pilose, margins entire to coarsely serrate, apex acute, short-acuminate, or shortcuspidate, baserounded to cuneate.

Flowers: Cyathia in dense terminal cymes; involucre 22.5 mmhigh, glabrous.

Fruits: Capsulessubglobose, 3-4mm long, glabrous.
Seeds: Seeds dark brownish gray to black, sometimes mottled, truncate-ovoid, angled, 2-2.5 mm long, coarsely tuberculate, ecarunculate.

## Euphorbia hirta L.

## Common Name : Asthma herb <br> Family : Euphorbiaceae

## Euphorbia hypericifolia auct.

## Common Name : G raceful sandmat Family : Euphorbiaceae

Habit: Prostrate or decumbent-ascending, annual herb, up to 40 cmhigh .

Stem: Often much branched from the base, often tinged with copper or reddish purple crispyhairy or patent-hairy or glabrous.

Leaves: Petiolate, glabrous and dark green above, appressed-pubescenton thelower surface.

Flowers: Cymesdenseon long peduncles.
Fruits: Depressed-globose.
Seeds: Smooth to transversely ribbed, corrugated, 4angled.

## Euphorbia indica Lam.

## Common Name : None <br> Family : Euphorbiaceae

| H abit: | Annual herb, up to 60 cm tall. |
| :--- | :--- |
| Stem: | Decumbent-ascending, suberect or erect, <br> sparingly puberulousor pubescent. |
| Leaves:Elliptic-oblong, $1-3 \times 0.5-1.5 \mathrm{~cm}$, obtuse, <br> obliquely rounded at the base, serrulate <br> except at the base on the inner margin, <br> subtriplinerved, green above, paler beneath. |  |
| Flowers:Cyathia aggregated together into loose <br> clusters, terminating short axillary shoots; <br> cyathial glands purplish, with white or pale <br> pink orbicular petaloid appendages. |  |
| Fruits:Trigonous, $1.5 \times 2$ mm, smooth, sparingly <br> pubescentorglabrous. |  |
| Seeds: | $1 \times 0.8$ mm, ovoid, roundly-quadrangular, <br> shallowly rugulose to almost smooth, grey, <br> ecarunculate. |

## Euphorbia microphylla Heyne ex Roth.

Common Name<br>Family<br>: None<br>: Euphorbiaceae

| H abit: | Annual herb, 10-20cm tall. |
| :--- | :--- |
| Stem: | Many from base, prostrate, 1-2 mm thick, light <br> red or red. |
| Leaves: | Opposite, scalelike, 3-5 $\times 2-3 \mathrm{~mm}$, baseextremely <br> oblique, margin subentire, apex rounded. |
| Flowers: | Cyathia single or paired, axillary, peduncle <br> absent. Male flowers 3-5, not exserted from <br> involucre or reaching margin. Female flower <br> pedicellate, nearly reaching margin of <br> involucre. |
| Fruits: | Capsule 3-angular, globose, $1.5 \times 1.5 \mathrm{~mm}$, <br> smooth, glabrous. |
| Seeds: | Ovoid-angulate, lightyellow, smooth. |

## Euphorbia thymifolia L.

## Common Name : Gulf sandmart <br> Family : Euphorbiaceae

| H abit: | Annual herb, up to 20 cm long, 1-3 mm in <br> diameter. |
| :--- | :--- |
| Stem: | Delicate, usually stoloni-shaped, multiramose, <br> sparsely pilose. |
| Leaves:Opposite, elliptic, oblong or obovate, 4-8 mm <br> long, 2-5 mm wide, apex rounded, base <br> oblique, in-equilateral, rounded or subcordate, <br> margins serrulate, rarely entire, sparsely pilose <br> on both surfaces, rarely glabrous. |  |
| Flowers:Inflorescences solitary or severally clustered at <br> leaf axils. M ale flowers several, slightly <br> exceeding involucres. Female flower 1, stipes <br> of ovariesvery shorter. |  |
| Fruits: | Appressed-pubescent, trivalved cocci. |
| Seeds: | Long, ovoid-tetragonal, 0.7 mm long, 0.5 mmin <br> diameter, scarlet. |

## Evolvulus alsinoides L.

## Common Name : Slender dwarf morning glory <br> Family : Convolvulaceae

| H abit: | A prostrate, annual or perennial herb. |
| :--- | :--- |
| Stem: | With spreading, wiry, silky hairy branches <br> arising from a woody rootstock and many <br> spreading branches. |
| Leaves: $\quad$Alternate, subsessileto short-petioled, variable <br> in shape: broadly ovate, elliptic or lanceol ate, <br> $0.8-2.6 \mathrm{~cm}$ long and up to 1 cm wide, acute to <br> rounded atboth ends, hairy on both sides. |  |
| Flowers: $\quad$Blueor white, campanulateto subrotate, $0.5-0.6$ <br> cmlong and wide, born 1-3together on axillary <br> peduncles $0.6-4 \mathrm{~cm}$ long. |  |
| Fruits: $\quad$Globose 4-valved, usually 4-seeded, capsule, <br> 0.3-0.4cmlong, glabrous. |  |
| Seeds: $\quad$Palebrowntoblack, ovoid, 1.5-1.7 mmlong. |  |

## Evolvulus nummularius (L.) L.

## Common Name : Roundleaf bindweed Family : Convolvulaceae

| H abit: | Perennial herb, 20-40cm high. |
| :--- | :--- |
| Stem: | Several, rooting at nodes, prostrate, slender, <br> villousor scabrous. |
| Leaves: | Nearly circular, $1.3-1.7 \times 1.2-1.4 \mathrm{~cm}$, glabrous or <br> appressed pilose abaxially, base cordate to <br> rounded, apex rounded or emarginate. |
| Flowers: | 1or 2per leaf axil; white. |
| Fruits: | Capsuleovoid, 2-3mmin diameter. |
| Seeds: | Brown, ovoid-trigonous, minutely tuberculate. |

## Fimbristylis dichotoma (L.) V ahl

## Common Name : Forked fimbry Family : Cyperaceae

H abit: Annual or shortlived perennial, 10-70cmtall.
Stem: Culmsslender to rather stout, compressed.
Leaves: Leaf blade pilose with tubercle based hairs on both sides.

Flowers: Corymb simple, compound or decompound; spikelets ovoid to ovoid-ellipsoid, 3-10 mm long.

Fruits: $\quad$ Nuts obovate to broadly ovate, 0.7-1.25 mm long, creamy, each side cancellated with 7-13 rows of transversely oblong cells.

## Fimbristylis miliacea (L.) V ahl.

## Common Name : G rass-like fimbry Family : Cyperaceae

## Fumaria parviflora Lam.

## Common Name : Fineleaf fumitory <br> Family : Fumariaceae

Habit: Annual herb, up to 60 cm tall.
Stem: Slender, much branched and succulent.
Leaves: 2-3 pinnatisect, 2-5 cm long, segments linearoblanceolate, apiculate.

Flowers: Purplish-red, spurred, in terminal or leaf opposed, bracteateracemes.

Fruits: Nuts globose, 2-3 mm in diameter, rugose whendry.

## G alium aparine L.

## Common Name : Stickywilly <br> Family : Rubiaceae

Habit: Anannual, up to 3mhigh.
Stem: Squarein crosssection.
Leaves: Long and narrow, borne in whorls of between 4-10atintervals along thestem.

Flowers: Flowers are extremely inconspicuous, consisting of small clusters of white, four petalled flowers, produced in the axils of the leaves.

Fruits: Small, hard, spherical, green at first before becoming purple.

## Glinus lotoides L.

Common Name : Lotus sweetjuice Family : Molluginaceae

H abit: A prostrateor ascending, annual herb, $15-45 \mathrm{~cm}$ long.

Stem: Much branched, stellately hairy, usually with a long, stout taproot, spreading and forming a loosemat.

Leaves: Opposite or falsely whorled, broadly obovate or suborbicular, 1-2.5 cm long and 0.8-1.5 cm wide, villous on both surfaces, apex apiculate, narrowed at the base, marginsfinely crenulatedenticulate.

Flowers: Pinkisk or greenish, in axillary fascicles, 1-6 together.

Fruits: Capsuleovoid, shorter than sepals, 5-valved.
Seeds: Minute, black, glossy, ovovoid, with raised tubercular points and a distinict white scale at the hilum, extended into a long filiform structure, curving around theseed.

## Glinus oppositifolius L.

## Common Name : Bitter cumin Family : Molluginaceae

Habit: Erect or ascending, some times prostrate, annual herb.

Stem: Slender, numerous, dichotomously branched.
Leaves: $\quad 1.3 \times 2.2 \mathrm{~cm}$ long in whorls of $4-5$, unequal, oblanceolate, or linear lanceol ate, or sometimes spatulate.

Flowers: Small, white, in axillary fascicles of 2 or more with long filiform pedicels.

Fruits: Capsuleellipsoid, alittleshorter than sepals.

## G naphalium polycephalum L.

## Common Name : White balsam <br> Family : Asteraceae

Habit: An annual herb, 30-60cm high.
Stem: Erect, branched above.
Leaves: Alternate, 7.5 cm long. 0.75 cm broad, tapering at base, sessile, margins little wavy, smooth above.

Flowers: Tubular, white, in obovate heads in a terminal and closepanicled corymb.

## G omphrena decumbens Jacq.

## Common Name : Prostrate globe-amaranth Family : A canthaceae

Habit: An annual or perennial, prostrate or decumbentherb.

Stem: Clothed with white, shaggy hairs.
Leaves: Subsessile, 1.5-5 x 0.5-1.5 cm, spathulate or oblong-lanceolate, acute, entire.

Flowers: White in sessile, terminal, subglobose heads or spikes, up to 4 cm long, piloseon theback.

Seeds: $\quad 1.5 \times 1 \mathrm{~mm}$, black, shining.

## G rangea maderaspatana (L.) Poir

## Common Name : Madras carpet Family : Asteraceae

H abit: A nnual, prostrateor procumbent herb.
Stem: Trailing, glandular, pubescent.
Leaves: $\quad 1.3-7 \mathrm{~cm}$, sinuately pinnatifid, coarsely serrate, dentate, sparsely hairy on both surfaces.

Flowers: Capitula somewhat flattened to conical, terminal, solitary or 2-3 together, each capitulum 6-13mmin diameter.

Fruits: Achene 2 mm long, pappus a short fimbriate tube.

## Heliotropium indicum L.

## Common Name : Indian heliotrope <br> Family : Boraginaceae

H abit: A nnual or perennial herb, 30-80 cmtall.
Stem: Erect, slightly woody at the base, unbranched or branchesfew.

Leaves: Alternate or sometimes subopposite, distinctly petiolate, petioles to 5 cm long, blade longdecurrent on petiole from a subtruncate base, ovate-deltoid, margin slightly wavy-crisped, $2.5-10 \mathrm{~cm}$ long, $1-5 \mathrm{~cm}$ wide, acute(blunt).

Flowers: Inflorescence terminal, simple or rarely onceforked, flowers along one side, sessile, tip coiled, axis up to 20 cm long; lowest flowers opening first; flowers pale violet (lilac) with a yellow throat, butfading to dull white.

Fruits: $\quad 3.5 \mathrm{~mm}$ long, ovoid, ribbed, separating into 2
 nutlets each 2-celled, $3-3.5 \mathrm{~mm}$ long.

## Heliotropium ovalifolium Forsk.

## Common Name : G rey leaf heliotrope Family : Boraginaceae

H abit: Perennial herb, up to 90 cm tall.
Stem: Much branched with woody base, young branchessilvery pubescent.

Leaves: Alternate, simple, elliptic to obovate, $5.5 \times 2.5$ cm , base cuneate, apex retuse, mucronate or acute.

Flowers: Inflorescence a spike like cyme, silky hairy, flowersarranged intwo ranks.

Fruits: Splitting into 4nutlets, densely hairy.

## Hemidesmus indicus (L.) R. Br.

$$
\begin{array}{ll}
\text { Common Name } & : \text { False sarsaparilla } \\
\text { Family } & : \text { Asclepiadaceae }
\end{array}
$$

Habit: A twining or prostrateperennial shrub.
Stem: Slender, cylindrical, thickened at nodes.
Leaves: Simple, opposite or whorled, short-petioled, variable in shape from broadly ovate to oblong-elliptical, linear or linear-lanceolate, obtuseor apiculate, $3-10 \mathrm{~cm}$ long and $0.3-3.5 \mathrm{~cm}$ wide, base acute, rounded or truncate, apex rounded or emarginateand apiculate, leathery, dark green above.

Flowers: Small, greenish-yellow outside and purplish inside, crowded in subsessile axillary cymes shorter than leaves.

Fruits: Follicle glabrous, often purplish, slender, cylindrical, sometimes curved, $10-12 \mathrm{~cm}$ long and $0.5-0.6 \mathrm{~cm}$ wide, divaricate.

Seeds: Black, flattened, ovate-oblong with a silvery
 coma.

## Heteropogon contortus (L.) R oem. \& Schult.

## Common Name : Spear grass <br> Family : Poaceae

Habit: A densely tufted, gregarious, perennial grass; $30-150 \mathrm{~cm}$ long.

Stem: Stems slender, erect or decumbent below with leafy atthebase.

Leaves: Leaf blades flat, linear, rigid, $4-30 \mathrm{~cm}$ long and $0.2-0.5 \mathrm{~cm}$ wide, apex shortly acuminate, sparsely ciliate towards the base; basal sheaths laterally compressed, keeled, glabrous; ligule short, truncate.

Flowers: Borne in terminal. Solitary, spiked racemes, 37.5 cm long, theawnsforming atwisted spireat thetop.

Fruits: $\quad$ Spikelets sessile, $0.5-0.8 \mathrm{~cm}$ long including the callus, closely imbricating, lower ones awnless, male or neuter, upper ones female, longawned, bearded with reddish-brown hairs.

## Hibiscus lobatus (J. A. M urray) O. Ktze.

Common Name : Lobed leaf mallow<br>Family : Malvaceae

| H abit: | Annual herb, 0.5-1.3mtall. |
| :---: | :---: |
| Stem: | Young stems pubescent, piloseor tomentellous. |
| Leaves: | Leaf-Iamina 2-12 $\times 1.5-10 \mathrm{~cm}$, suborbicular to ovatein outline, varying on the sameindividual from not lobed to deeply 3-5 palmatilobed or incised, usually pubescent on both surfaces with additional longer simple hairs on the veins and 2-4-pronged hairs mainly on the lower surface, lobes sometimes secondarily pinnately lobed or incised, apex acute to subcaudate, margin bluntly toothed or crenate or irregularly lobed, baseslightly to distinctly cordate. |
| Flowers: | 12 cm in diameter, white to yellowish, in fewflowered terminal racemes. |
| Fruits: | Capsule $10 \times 7 \mathrm{~mm}$, oblong-ellipsoid, pubescent, with awns $1.5-2 \mathrm{~mm}$ long. |
| Seeds: | 1.5-1.3 mm, irregularly prismatic, minutely verruculose, otherwiseglabrous. |

## Hibiscus panduriformis Burm.

## Common Name : Yellow hibiscus <br> Family : Malvaceae

| H abit: | Shrub-likeperennial, up to 2.5 m tall. |
| :--- | :--- |
| Stem: | With awoody baseand stellatehairs. |
| Leaves: | Almost round in outline, shallowly 3-5 lobed, <br> hairy on both surface. |
| Flowers: | Solitary, axillary, yellow with a dark centre, <br> turning apricot-orangewith age. |
| Fruits: | Capsulesub-spherical, 1.5mmin diameter. |
| Seeds: | $3 \times 2$ mm, crescent to kidney-shaped, densely <br> pubescent. |

## Hibiscus vitifolius Linn.

## Common Name : Tropical rose mallow Family : Malvaceae

Habit: A herband almostashrub, up to 2.5 mtall .
Stem: Erect, densely velvety-hairy.
Leaves: $\quad 2.5-6 \mathrm{~cm}$ long, 2.5 cm broad, sub-cordate, rounded at the base, acute at apex, serrate to crenate, not lobed or shallowly 3-7 lobed, broadly ovate to orbicular, densely pubescent on both thesurfaces.

Flowers: Occur singly in leaf axils, yellow with a large purplecentre.

# Hydrolea zeylanica (L.) V ahl 

Common Name : Ceylon hydrolea Family : Hydrophyllaceae

| H abit: | Soft, unarmed, herbaceous perennial, but flowering the first year from seed, therefore seemingly annual, 7-100 cm tall or more, often repent. |
| :---: | :---: |
| Stem: | Repeatedly branched, glabrous below the flowering branches. |
| Leaves: | Glabrous or very thinly puberulent on the petiole, veiny below, lanceol ate to elliptic, 2-12 cm long, $6-12 \mathrm{~mm}$ wide, on winged petioles up to 5 mm long. |
| Flowers: | Flowers in irregularly bracted racemes or panicles, the inflorescence branches, pedicels, and calycesstipitateglandular; flowersblue. |
| Fruits: | Capsular, 4-4.5 mm high, septicidally dehiscent, seated in the persistent calyx. |
| Seeds: | Numerous, lessthan 0.5 mm long. |

Seeds: $\quad$ Numerous, less than 0.5 mm long.

## Hyptis suaveolens (L.) Poit.

Common Name : Pignut<br>Family : Lamiaceae

H abit: A rigid, , sweetly aromatic herb, sometimes up to 2 mtall .

Stem: Erect, much-branched, obtusely quadrangular.
Leaves: Very variable, broadly ovate to suborbicular, margins crenate-serrulate, tomentose and dotted with oil globules beneath; lower leaves 12 cm long and 9 cm wide, base subcordate, upper leaves smaller, baseacute.

Flowers: Small, blue, borne 2-4 together in axillary or terminal heads in racemes.

Fruits: Nutlets blackish-brown, ovoid-oblong, compressed, 0.3 cm long, pubescent with mucilaginoushairs.

## Imperata cylindrica (L.) Raeusch.

Common Name : Cogon grass<br>Family : Poaceae

| H abit: | A perennial grass. |
| :--- | :--- |
| Stem: $\quad$Culms areshort, erect and arisefrom rhizomes. <br> The rhizomes aretough, white, commonly 1 m <br> long but can beconsiderably more, extensively <br> branched and covered with papery scaleleaves <br> at thenodes. |  |
| Leaves:Stiff, linear-lanceolate, up to 120 cm long and 4- <br> 18 mm wide, with a prominent white midrib, <br> scabrid margin and pointed tip. Theliguleis an <br> inconspicuousmembrane. |  |
| Flowers: $\quad$Inflorescence is a white, spikelike panicle, <br> terminal, fluffy, 5-20 cm long and up to 2.5 cm <br> in diameter. Spikelets are numerous, $3.5-5.0$ <br> mm long, each surrounded by a basal ring of <br> silky hairs 10 mm long. |  |
| Fruits:Grain is oblong, pointed, brown and 1-1.5 mm <br> long. |  |

## Indigofera cordifolia Heyne. ex Roth.

```
Common Name : Heart leaf indigo
Family : Fabaceae
```

H abit: Prostrate, annual herb, 8-15cmlong.
Stem: Branched, hairy.
Leaves: $\quad$ Simple, 6-16 mm long, 4-13 mm broad, nearly stalkless, broadly ovate, heart-shaped, obtuse tipped, ending in a sharp point. Leaves are velvetty hairy on both sides.

Flowers: Inflorescence is nearly stalkless, 4-8 flowered head; flowers brightred, pea-shaped.

Fruits: $\quad 4-5 \mathrm{~mm}$ long, oblong, densely pubescent, 2seeded.

## Indigofera linifolia (L.f.) Retz.

Common Name : None<br>Family : Fabaceae

H abit: A slender, trailing or procumbent, annual herb, to 45 cm long.

Stem: Numerous, much-branched, stems and leaves covered by silvery pubescence.

Leaves: Linear, 3 cm long and 0.4 cm wide.
Flowers: Deep pink to bright red, 5-8 mm long, borne in subsessileracemes.

Fruits: Pod $1.5-2 \mathrm{~mm}$ long, globose, hard, silvery pubescent, apiculate, 1 -seeded.

## Indigofera linnaei Ali.

## Common Name : Birdsvilleindigo Family : Fabaceae

| H abit: | A small trailing, annual or perennial herb. |
| :---: | :---: |
| Stem: | Much-branched, grey pubescent, with a woody rootstock; branches $30-45 \mathrm{~cm}$ long. |
| Leaves: | Nearly sessile, imparipinnate, rachis $1.5-2 \mathrm{~cm}$ long; leaflets usually 7-9, alternate, subsessile, oblong-ovate, $3-12 \mathrm{~mm}$ long and $1.5-5 \mathrm{~mm}$ wide, obtuse or emarginated at apex, cuneate at base, appressedly white pubescent on both surfaces. |
| Flowers: | Small, borne in sessile or short-peduncled 10-20-flowered axillary spikes up to 1.5 cm long; brightred, slightly exserted. |
| Fruits: | Pods $3-4 \mathrm{~mm}$ long and $1.5-2 \mathrm{~mm}$ in diameter, oblong, cyclindrical, more or less clothed with whiteappressed hairs. |
| Seeds: | Globose. |

## Indoneesiella echioides (L.) Sreem.

Common Name : False waterwillow<br>Family : A canthaceae

Habit: A nerect, annual herb, up to 60 cm tall.
Stem: Grooved, quadrangular, clothed with spreading hairs.

Leaves: $\quad 3.2-7.5 \mathrm{~cm}$ long and 1-2.5 cm wide, oblong or sub-elliptic, obtuse, sparsely hairy, ciliate al ong margins, basecuneate.

Flowers: Numerous, with a pink or white corolla with dark purple blotches on the lower lip, densely pubescent outside, borne along the upper side of a slender, glandular-hairy rachis, in axillary racemes.

Fruits: Capsules 1-1.3 cm long and half as broad, compressed, acuteat both ends, hairy.

Seeds: Oblong, up to 2.5 mm long, not compressed, pitted, glabrous.

## Ionidium suffruticosum (L.) Roem. \& Sch.

## Common Name : Spade flower <br> Family : Violaceae

H abit: A small perennial herb, $15-30 \mathrm{~cm}$ tall.
Stem: With a woody base, numerous diffuse or ascending branches.

Leaves: $\quad$ Subsessile, linear to oblanceolate, $4-5 \mathrm{~cm}$ long and 0.2-0.8cm wide, margins entireor serrate.

Flowers: Solitary, axillary, red or purple, pedicels 6-12 mmlong, erectslender.

Fruits: Small subglobosecapsules, 0.6 cm in diameter.
Seeds: Ovoid, longitudinally striate, yellowish-white, 1.5 mm long.

## Ipomoea aquatica Forssk.

Common Name : Water spinach Family : Covolvulaceae

Habit: A sprawling vine, annual or perennial, creeping on mud or floating on water; up to 3 m long, to 1 cmin diameter.

Stem: Terete, branched, hollow and succulent when floating, otherwisesolid and firm.

Leaves: Emersed, glabrous, alternate; petioles succulent when grown in water, $3-20 \mathrm{~cm}$ long; blades greenish-brown, triangular, ovate, lanceolate, or linear, entire to dentate, 3-15 cm long, 1-12 cm across, bases truncate, cordate, hastate, or sagittate, lobes rounded to acute, entireto dentate.

Flowers: Inflorescences axillary cymes, with one to a few flowers; peduncles $0.5-18 \mathrm{~cm}$ long. Flowers perfect, hypogenous, large and showy, funnel shaped, glabrous, pink, often with darker eye, sometimes whiteor cream.

Fruits: A capsule, glabrous, globose to ovoid, 8-10 mm long.

Seeds: Brown or black, mostly pubescent, 3-ranked, rounded on back, about 5 mm long, about 4 mm

## Ipomoea cairica (L.) Sweet.

## Common Name : Cairo morning glory <br> Family : Convolvulaceae

Habit: An extensiveperennial climber.
Stem: Tubercled with tuberous rootstock.
Leaves: Ovate to orbicular in outline, 3-10 cm long and wide, deeply palmately 5-7-lobed, the lobes Ianceolate to ovate or elliptic, acute or obtuse and mucronateat theapex, $3-5 \mathrm{~cm}$ long.

Flowers: Purple, blue-purple or white with a purple centre, funnel-shaped, $4.6-6 \mathrm{~cm}$ long, borne1 or 3together in exillary cymes.

Fruits: Capsular, subglobose, 1-1.2cmlong, glabrous.
Seeds: Subgloboseto ovoid, blackish to tan, $0.4-0.6 \mathrm{~cm}$ long, densely short-tomentose, sometimes with long silky trichomes al ong theedges.

## Ipomoea carnea Jace.

## Common Name : Bush morning glory Family : Convolvulaceae

H abit: A robust, perennial shrub, 1-5mtall.
Stem: Branched, Iuster green with milky latex.
Leaves: Ovate-lanceolate, pubescent, particularly beneath.

Flowers: Flowers in clusters at theends of branches, pale to deep pink, darker in thecorollathroat.

Fruits: Capsuleglabrous, dehiscent, brown.

## Ipomoea coccinea L.

## Common N ame Family <br> : Red star <br> : Convolvulaceae

Habit: A vineor shrub, up to several metreslong.
Stem: Slender or scandent.
Leaves: Ovate, broadly cordate, $6-12 \mathrm{~cm}$ long, apex acute or acuminate, margins subentire, angled or broadly 3-5lobed.

Flowers: Erect, red, borne in long-peduncled, fewflowered axillary cymes, up to 15 cm long.

Fruits: Capsules subglobose or ovoid, 0.6 cm in diameter.

## Ipomoea hederacea (L.) Jacq.

## Common Name : Ivy leaf morning glory Family : Convolvulaceae

| H abit: | An annual vine. |
| :--- | :--- |
| Stem: | Twining or climbing. |
| Leaves: | Alternate, hairy, petioled, 2-5 inches long and <br> distinctly 3-lobed orivy shaped. |
| Flowers: | $1-2$ inches long, with petals fused into afunnel; <br> purpleor blueor whitein color. |
| Fruits: | Capsule, spherical, 3-locular, brown. |

## Ipomoea obscura (L.) Ker Gawl.

## Common Name : Obscure morning glory Family : Convolvulaceae

## Iopomoea pes-caprae (L.) R. Br..

Common Name : G oat's foot Family : Convolvulaceae

H abit: An evergreen perennial vine.
Stem: Flexible, 1.3 cm in diameter, branches freely and roots at thenodes.

Leaves: Fleshy, leathery, 10 cm long, notched at the apex, creating two equal lobes.

Flowers: Very showy, pink to lavender purple, funnel shaped.

Fruits: Round, lessthan 5 inches, hard, not showy.

## Iopomoea pes-tigridis L.

## Common Name : Tiger foot morning glory <br> Family : Convolvulaceae

## Ipomoea turbinata Lag.

## Common Name : Lilac bell Family : Convolvulaceae

| H abit: | A largeannual, glabrousvine. |
| :--- | :--- |
| Stem: | Muricate. |
| Leaves: | $7-18 \mathrm{~cm}$ long and $6-13 \mathrm{~cm}$ wide, ovate to <br> orbicular, glabrous, basecordate, apex acuteto <br> acuminate, marginsentire. |
| Flowers: | Inflorescence a few flowered peduncle, $3-6 \mathrm{~cm}$ <br> Iong; flowers funnel shaped, lavender to <br> purplish. |
| Fruits: | Capsular, ovoid, apiculate, $1.8-2 \mathrm{~cm}$ long and <br> 1.3 to 1.7 cm in diameter. |
| Seeds: | Ovoid, smooth, shiny, black, 1 cm long. |

## Ischaemum indicum.

## Common Name : Indian murainagrass

Family : Poaceae

H abit: Perennial grass; 6-75cmtall.
Stem: Erect, geniculate or decumbent and rooting at the lower nodes, sometimes creeping extensively to form colonies, the internodes glabrous, the nodes usually pilose on the sheath base, sometimes nearly glabrous.

Leaves: $\quad 3-11 \mathrm{~cm}$ long, 2-6 mm wide, linear to linearlanceolate, usually at least sparsely pubescent, sometimes villous, pseudopetioles not developed, the base gradually narrowed to abruptly rounded, the tip acuminate, the marginsscaberulous.

Flowers: Racemes two 1-5 cm long, appressed to spreading; peduncle glabrous, usually longexserted;

Fruits: Caryopsis $1.2-1.3 \mathrm{~mm}$ long, $0.6-0.7 \mathrm{~mm}$ wide, fitting into thelower hump of theupper glume.

## Ischaemum rugosum Salisb.

Common Name : Wrinkled duck-beak Family : Poaceae

| H abit: | A vigorous annual (in strongly desiccating soil) or short-lived perennial, up to 1.5 mtall . |
| :---: | :---: |
| Stem: | Tufted, sometimes with stilt roots, rooting at the nodes, with erect, slanting or ascending, often much-branched culms. |
| Leaves: | The leaf blades are acuminate, the lower ones narrowed gradually to the base; 30 cm long, 1.5 cm wide; the margin is cartilaginous and scabrid, the base densely hairy. The ligule is variable, a brownish membrane, 6 mm deep. |
| Flowers: | The inflorescence is terminal, apparently simple when young, but separating with age into its two constituent racemes, usually 7-10 cm long; each raceme with the spikelets arranged in pairs, one sessile, one pedicelled, on onesideof thetriangular, hairy rachis. |
| Fruits: | Spikelets are boat shaped; yellowish brown, shiny; lower glume of the sessile spikelets is membranous with distinct transverse ridges (hencerugosum). |

## Lagascea mollis Cav.

## Common Name : Silk leaf <br> Family <br> : A steraceae

Habit: An annual herb, 50-100cmtall.
Stem: Sometimes purplish, with stipitate glandular hairs on young parts.

Leaves: Opposite, simple, ovate, with toothed margin, $3-5 \mathrm{~cm}$ long; silky beneath.

Flowers: Tiny white-cream colored flowers occur in a composite head $2-3 \mathrm{~cm}$ across. The heads are surrounded by silky leaves.

Fruits: Achenes brown or black, 3 mm long, setuliferous near apex; pappus a minute crown, pubescent.

Seeds: Subcylinderic, truncate at apex, reddish brown.

## Lantana camara L.

## Common Name : Wild sage <br> Family : Verbenaceae

Habit: A perennial shrub, 2-5 mtall.
Stem: Woody, 4-angled, often bearing recurved prickles.
Leaves: Serrated leaves are ovate to ovate-lanceolate (up to 10 cm long and 7.5 cm wide) and usually light colored.

Flowers: Yellow and pink, later turning orange then red and sometimes blueor purple.

Fruits: Black, fleshy drupes, borne in clusters, 3-6 mm in diameter and contain 1-2seeds.

## Lathyrus aphaca L.

## Common Name : Yellow pea <br> Family : Fabaceae

H abit: A suberect annual herb.
Stem: Scrambling or trailing, glabrous.
Leaves: Leaflets modified into long tendrils; stipules ovate-rounded, 0.5-3 X 1-2 cm, appressed to stem.

Flowers: Yellow, axillary, solitary, on long peduncles.
Fruits: Pods are glabrous, straight or incurved, 2-3.5 cmlongand $0.3-0.8 \mathrm{~cm}$ wide, with 6-8seeds.

Seeds: Ellipsoid to globose, usually flattish with a glossy, smooth, dark purple-brown to black surface, sometimes spotted to marbled.

## Lathyrus sativus L.

Common Name : Grass pea<br>Family : Fabaceae

Habit: A much-branched, straggling or climbing, herbaceousannual; 25-60cmlong.

Stem: Quadrangular with winged margins. Stipules are prominent, narrowly triangular to ovate with a basal appendage.

Leaves: Pinnate leaves are opposite, consisting of one or two pairs of linear-lanceolate leaflets, 5-7.5 x 1 cm , and a simple or much-branched tendril. Leaflets are entire, sessile, cuneate at the base and acuminateat thetop.
Flowers: Axillary, solitary, about 1.5 cm long, and may be bright blue, reddish purple, red, pink, or white.

Fruits: Pods are oblong, flat, slightly bulging over the seeds, about 2.5-4.5 cm in length, 0.6-1.0 cm in width and slightly curved; dorsal part of thepod is 2-winged, shortly beaked and contains 3-5 small seeds.

Seeds: $\quad 4-7 \mathrm{~mm}$ in diameter, angled and wedge-shaped; white, brownish-grey or yellow, although spotted or mottled forms al so exist.

## Launaea nudicaulis (Linn.) H ook. f.

Common Name : Bold-leaf Iaunaeae Family : Asteraceae

Habit: Perennial herb with a taproot and often shoot bearing lateral roots, up to $40-50 \mathrm{~cm}$ high.

Stem: A shortwoody caudex.
Leaves: One or a few basal leaf rosettes, each usually with several procumbent to ascending-erect, divaricately branched, occasionally straggling flowering stems; Caudical leaves 2-12 x 0.5-3.5 cm , rather variable, narrowly spathulate in outline, sinuate-dentate to irregularly pinnatifid to mostly runcinate, with acuteapex and acute segments, margin sinuate-dentate and denticulate.

Flowers: Inflorescence of a flowering stem ending in a single capitulum and with a variable number of flowering branches; peduncles 2-15 mm long, wiry, spreading-erect; flowers usually yellow.

Fruits: Achenes $2.6-5.5 \times 0.5-1.0 \mathrm{~mm}$, heteromorphic, with 4 main ribs, smooth to somewhat transversely wrinkled, pale.

## Launaea sarmentosa (Willd.) Sch. Bip.

Common Name : Beach Launaea<br>Family : Asteraceae

| H abit: | An annual or perennial, rosulate, creeping, glabrous. |
| :---: | :---: |
| Stem: | Stems several, flagelliform, creeping, $20-90 \mathrm{~cm}$, branched; nodes $4-15 \mathrm{~cm}$ apart, with adventitious roots and secondary leaf rosettes. |
| Leaves: | Rosette leaves spatulate, 3-8 $\times 0.6-1 \mathrm{~cm}$, sinuate-dentate to pinnately lobed, attenuate towards base, margin weakly to distinctly denticulate, apex acute, obtuse, or rounded. |
| Flowers: | Capitulum solitary, terminating secondary leaf rosettes al ong stems, with usually 14-18florets; corollayellow. |
| Fruits: | Achenes weakly dimorphic, brownish to blackish, columnar to cylindric, 3-5 mm; outer achenes with 5 thick soft ribs, smooth, apex pointed to subtruncate; inner achenes with 4 ribs. Pappus $4-8 \mathrm{~mm}$, caducous with pappus disk. |

## Leonitis nepetaefolia (L.) R. Br.

## Common Name : Lion's ear <br> Family <br> : Lamiaceae

H abit: A herbor shrub, 1.2-2.6mtall.
Stem: Stem and branches obtusely 4-angled, deeply grooved on oppositesides, finely tomentose.

Leaves: Upper leaves ovate-lanceolate, $5.6-8.5 \mathrm{~cm}$ long and 1.5-2.6 cm wide, acute at base; lower leaves ovate to broadly ovate, $4-20 \mathrm{~cm}$ long and 3-15 cm wide, broadly rounded or truncate at base; all leaves acute to subacute at apex with crenate-serratemargins.

Flowers: Orange-scarlet, bristly, borne in dense, globose, axillary whorls, $3.8-6.3 \mathrm{~cm}$ in diameter; floral leaves lanceolate, deflexed; bracts linear, up to 16 mm long, strongly spinous-pointed, deflexed, pubescent.

Fruits: Nutlets oblong-ovoid, about 0.4 cm in diameter, obliquely truncate with ribbed margins.

## Lepidium sativum L.

## Common Name : Pepper grass <br> Family : Brassicaceae

H abit: A small herbaceous annual; 15-45cmtall.
Stem: Erect, branched, glabrous.
Leaves: Variable, entire or variously lobed or pinnatisect. Lower leaves long-petioled, twice pinnatisect; upper leaves sessile, linear, linearoblong or pinnatifid.

Flowers: Small, whitein long racemes.
Fruits: An ovoid, flattened silique, measuring 4.5-6.5 $\mathrm{mm} \times 3-4 \mathrm{~mm}$, pale green to yellowish, with prominentapical wings.

Seeds: $\quad$ Sub-ovoid, flattened, measuring 2-3 mm X 1.5 mm , wingless and reddish brown.

## Leptochloa chinensis (L.) Nees.

## Common Name : Chinese sprangletop Family : Poaceae

| H abit: | An aquatic or semi-aquatic tufted annual or <br> perennial grass. |
| :--- | :--- |
| Stem: | Stout to slender, erect or geniculateculms up to <br> 1.5 mtall, often rootingatthelower nodes. |
| Leaves: | Leaf-sheath loose, subglaucous, smooth, up to <br> 10 cm long; ligule a fringed, hairy membrane, <br> $1-2 \mathrm{~mm}$ long; leaf-bladelinear, up to $50 \mathrm{~cm} \times 1$ <br> cm, long-attenuate, flat or folded, scabrid <br> above. |
| Flowers: $\quad$Inflorescence 10-60 cm long, composed of <br> numerous slender racemes scattered along an <br> elongate central axis; racemes flexuous, 2-13 <br> cmlong, erector laxly ascending. |  |
| Fruits: | Spikelets 3-7 flowered, narrowly elliptical- <br> oblong, 2-3 mm, subsessile, often purplish, <br> disarticulating abovetheglumes and between <br> theflorets. |
| Seeds: | Caryopsis ellipsoid-oblongoid, 6-9 mm long, <br> brown, smooth orwrinkled. |

## Leucas aspera (Willd.) Link.

## Common Name : Common leucas Family : Lamiaceae

H abit: An annual herb; 15-45cmtall.
Stem: Erect, usually much diffusely branched from below, stout, hispid. Branches quadrangular, hispid.

Leaves: Linear or oblong, 2.5 to 7.5 cm long with blunt tips and scalloped margins.

Flowers: Whorls are large, terminal and axillary, about 2.5 cm in diameter and crowded with white bell shaped flowers.

Fruits: Nutlets long-oblong sub-truncate at the apex, smooth and brown.

Seeds: Subcylinderic, truncate at apex, reddish brown.

## Leucas cephalotes (Roth) Spreng.

## Common Name : none <br> Family <br> : Lamiaceae

## Leucas martinicensis R. Br.

## Common Name : Whitewort <br> Family : Lamiaceae

H abit: Anerectannual herb, up to 1mhigh.
Stem: Usually unbranched, finely hairy.
Leaves: Opposite, ovate to ovate-lanceolate, margins coarsely serrate-crenate.

Flowers: Inflorescence of several spaced, manyflowered verticils with long thistlelike calyx teeth. Flowerssmall, white.

Fruits: Nutlets dark brown, oblong-ovoid, 1.5 mm long, shiny.

## Leucas zeylanica (L.) R. Br.

## Common Name : Ceylon slitwort Family : Lamiaceae

Habit: An erect, pubescent or hispidly hairy annual herbup to 50 cmtall .

Stem: Grooved with quadrangular branches.
Leaves: Opposite, 2.5-7.5 cm long and $0.8-1.3 \mathrm{~cm}$ wide; linear or linear-lanceolate, apex obtuse, margins entire or slightly serrate, often slighly recurved, hispid on both sides, basetapering.

Flowers: White, sessile or nearly so, born in teminal whorls, 1.3-2cmin diameter.

Fruits: Nuteletssmall, obovoid-oblong, dark brown or black, shining.

## Limnocharis flava (L.) Buchenau.

## Common Name : Yellow velvetleaf Family : Limnocharitaceae

H abit: Perennial aquaticherb.
Stem: A short thick erect rhizome, the scapes erect, $20-40 \mathrm{~cm}$ high.

Leaves: Erect or ascending, not floating, often exceeding the scapes, long-petiolate, the petiole vaginate; leaf blades variable in shape, Ianceolate to oblong-elliptic, sometimes broadly ovate, mostly $8-18 \mathrm{~cm}$ long, acute to rounded at theapex, attenuateat the base.

Flowers: Inflorescences umbelliform, 2-12 flowered, the pedicels $3-4 \mathrm{~cm}$ long, somewhat dilated and trigonous above; flowers yellow, about 1.5 cm broad.

Fruits: $\quad$ Folliclesabout 1 cm long.

## Lindernia antipoda (L.) Alston.

## Common Name : Sparrow false pimpernel <br> Family : Scrophulariaceae

Habit: A nnual or perennial herbs.
Stem: Erect or decumbent, and then usually rooting at lower nodes, branched at base, glabrous.

Leaves: Elliptic to oblanceolate or obovate, 1-2.5 cm long, $0.6-0.8 \mathrm{~cm}$ wide, glabrous, margins entire to remotely serrate, sessile.

Flowers: Solitary in the leaf axils or sometimes appearing racemose by reduction of upper leaves; pale violet or violet blue to paleblue or white.

Fruits: Capsulescylindrical, 5-14mmlong.
Seeds: Oblong to ellipsoid, 0.5 mm long, reticulate.

## Lindernia ciliata (Colsm.) Panuell.

## Common Name : Fringed false pimpernel Family : Scrophulariaceae

| H abit: | Annual herb, 20 cm tall. |
| :--- | :--- |
| Stem: | Erect or diffuse, much branched; branches <br> decumbent, sometimes rooting fromlast node. |
| Leaves: | Sessile or short petiolate; leaf blade oblong to <br> lanceolate-oblong, $0.7-4.5 \times 0.3-1.2 \mathrm{~cm}$, <br> glabrous, base amplexicaul, margin densely <br> aristate-serrate, apex acuteto obtuse. |
| Flowers: $\quad$Racemes terminal; Flowers light purple or <br> white. |  |
| Fruits: | Capsule cylindric, as long as persistent calyx, <br> apexmucronate. |
| Seeds: | Irregularly triangular. |

## Lindernia crustacea (L.) F. M uell.

## Common Name : M alaysian false pimpernel Family : Scrophulariaceae

H abit: An erect or prostrate, glabrous annual herb; up to 30 cm tall.

Stem: Diffusely branched, rooting at thelower nodes.
Leaves: Ovate, $0.5-2 \mathrm{~cm}$ long and $0.4-1.5 \mathrm{~cm}$ wide, apex acute or obtuse, base rounded or subcordate, marginsentireto crenate-serrulate.

Flowers: Axillary, solitary, 6 mm long, blue-white; lower lip with ayellow spotatthebase.

Fruits: Capsule ellipsoid, oblong, apiculate with a persistent style, $3-5 \mathrm{~mm}$ long and $2-3 \mathrm{~mm}$ wide.

## Lindernia procumbens (Krock.) Philcox.

## Common Name : Prostrate false pimpernel Family : Scrophulariaceae

| H abit: | A n annual herb, 5-20 cmtall. |
| :---: | :---: |
| Stem: | Erect, cespitose, basally much branched, glabrous. |
| Leaves: | Sessile, elliptic to oblong, somewhat rhomboid, 1-2.5 X 0.6-1.2 cm, glabrous, margin entire or weakly obtusely toothed, apex obtuse to rounded. |
| Flowers: | Axillary, solitary, pink to purple. |
| Fruits: | Capsulegloboseto ovoid-globose, as long as or slightly longer than persistent calyx. |
| Seeds: | Oblong; seed coat reticulate. |

## Ludw igia adscendens (L.) H. H ara.

Common Name : Creeping water primrose Family : Onagraceae

Habit: An aquatic or sub-aquatic perennial herb that may be emergent, may be anchored, with horizontal extensions over thewater surface, or may befreefloating.
Stem: Stems up to 1 m ; horizontal stems up to 4 m , normally glabrous, with long, fibrous roots, as well as adventitious, modified, spindle-shaped, nodal aerophores or air roots, that grow erect and may extend above the water surface. Stems areyellow-green or reddish in someareas.
Leaves: Alternate, broadly oblong-elliptic, rounded or obtuse at apex, up to 10 cm long, 4 cm wide, narrowed at thebaseto a distinctpetiolewhich may bered.
Flowers: Borne singly at upper leaf axils; bright yellow to very pale yellow or white, up to 2 cmlong.
Fruits: A capsulethick-walled, woody, 2 to 3 cm long and 3 mm in diameter, more or less cylindrical, often some-what curved, surmounted at apex by calyx, glabrous or with soft long hairs, 5-locular, light brown with 10 conspicuous darker brown ribs, seeds evident as bumps between the ribs, irregularly dehiscent, basenarrowed.
Seeds: Pale brown, many in orderly rows, some 4-angled and some prismoid, 1 to 2 mm in size, firmly imbedded in coherent cubes of woody endocarp which are fused to capsulewall.

## Ludwigia octovalvis (Jacq.) Raven.

## Common Name : Primrose willow Family : Onagraceae

| H abit: | A semi-shrubby, erect, annual or perennial herb; 0.3-1.2mtall. |
| :---: | :---: |
| Stem: | Woody below, much branched. |
| Leaves: | Alternate, nearly sessile, pubescent to glabrescent, variable in size and shape, 0.7-14 cm long and $0.1-4 \mathrm{~cm}$ wide, linear to broadly elliptic, apex acute to attenuate; base narrowly to broadly cuneate. |
| Flowers: | Yellow, pubescent, solitary, borne in axils of upper leaves. |
| Fruits: | Capsule membranous, subquadrangular, cylindrical, 8 -ribbed, $2.5-5 \mathrm{~cm}$ long. |
| Seeds: | Minute, ovoid, shiny, brown. |

## Ludwigia parviflora Roxb.

## Common Name : Water primerose <br> Family : Onagraceae

Habit: Stoutsucculentherb, up to 3 mtall.
Stem: Well branched, sometimes woody at the base, usually somew hatreddish, glabrous.

Leaves: $\quad 2-13 \times 0.5-3.5 \mathrm{~cm}$, lanceolate or broadly elliptical, narrowly cuneate at the base, the apex subacute.

Flowers: Clustered on short axillary shoots, also bearing reduced leaves; yellow.

Fruits: Capsule $10-20 \times 1.2 \mathrm{~mm}$, relatively thinwalled, glabrous, terete, light brown, at first thin-walled and torulose, but as the endocarp swells and hardens, becoming smooth; pedicels $0.5-3 \mathrm{~mm}$ long.

Seeds: $\quad 0.6-0.75 \times 0.4-0.5 \mathrm{~mm}$, uniseriatein each locule of the capsule, diagonal, brown, obovoid; each seed loosely but completely embedded in an easily detached piece of soft powdery endocarp.

## M alachra capitata (Linn.) Linn.

Common Name : Brazil Jute<br>Family<br>: Malvaceae

Habit: An annual or perennial herb, 1-2mtall.
Stem: Mostly erect, coarse, throughout densely whitish or yellowish-tomentose with stellate hairs and usually also moderately to copiously hispid with simple or stellate hairs up to 2 mm long.

Leaves: Long-petioled; orbicular to ovate, $2-10 \mathrm{~cm}$ long, palmately sinuate to 3-7 lobed, lobes mostly obtuse, crenate to serrate, the base obtuse or truncate.

Flowers: Axillary, pedunculate, bracteateheads; yellow.
Fruits: Mericarps 3-3.5 mm long, muticous, reddish veined, puberulent.

Seeds: Obovoid-cuneate, about 2.5 mm long, black, whitish-pubescent abouthilum.

## Malva parviflora Linn.

## Common Name : Little mallow <br> Family : Malvaceae

| Habit:An erect, sprawling or decumbent herb <br> growingup to 50 cmhigh. |  |
| :--- | :--- |
| Stem: | Covered with stiff star-like (stellate) hairs and <br> can be erect or ascending (at first spreading <br> horizontally and then becoming erect) and <br> ratherfibrous. |
| Leaves: | Circular and 8-10 cm in diameter. The base of <br> the leaf is cordate, margins are crenate, <br> sparsely pubescent. The leaves are palmately <br> veined with 5-7 short triangular lobes. The <br> petiole ismostly 1.5-12 cmlong. |
| Flowers:Whiteor pink in color, and twisted inthebud. |  |
| Fruits: | Schizocarp, 7-8 mm in diameter and separates <br> into 8-12, one seeded mericarps. The <br> schizocarp is disc-shaped surrounded by the <br> calyx and brown when ripe. |
| Seeds: | Subcylinderic, truncate at apex, reddish <br> brown. |

## M alvastrum coromandelianum (L.) G arcke.

## Common Name : Spine seeded falsemallow <br> Family <br> : M alvaceae

## Marsilea quadrifolia L.

## Common Name : European waterclover Family : Marsileceae

| H abit: | A small aquaticfern. |
| :--- | :--- |
| Stem: | Slender, creeping rhizome. |
| Leaves: | Quadrifoliate with long slender petioles; <br> leafletsobovate-retuse, glabrous, arranged in a <br> whorl. |
| Flowers: | Absent. |
| Fruits: | Fructifications (Sporocarps) are dark brown, <br> hard, bean shaped, with two unequal horns. |

## Martynia annua L.

## Common Name : Devil's claw Family : Pedaliaceae

Habit: A herbaceous, annual, 0.3-2mhigh.
Stem: Erect, branched, glandular-hairy.
Leaves: Opposite, broadly ovate to deltoid, $7-23 \mathrm{~cm}$ long and $7-20 \mathrm{~cm}$ wide; base cordate, apex acute, margins repand-dentate; petioles 7-18 cmlong.

Flowers: Large, foxglove-shaped, pink and dark purple botched with yellow inside, borne in 10-20 flowered racemes, $4-10 \mathrm{~cm}$ long.

Fruits: Hard, woody, with 2sharp recurved hooks.
Seeds: Oblong, black, hairy and shining.

## Mecardonia procumbens (Mill.) Small.

Common Name : Baby jump-up<br>Family : Scrophulariaceae

| H abit: | Annual herb. |
| :--- | :--- |
| Stem: | 4-angled, simple or branching from the base, <br> decumbent to ascending to prostrate and <br> creeping, glabrous. |
| Leaves: | Sessile to somewhat amplexicaul, ovate, 5-20 <br> mmlong, 3-10 mm wide, basetapering, obtuse <br> to rounded at the apex, margins crenate, <br> glabrous. |
| Flowers: $\quad$Solitary; yellow. |  |
| Fruits: $\quad$Capsule ovoid, 4-6mm long, brown, glabrous, <br> included inthecalyx. |  |
| Seeds: $\quad$Ellipsoid, 0.3 mmlong, reticulate. |  |

## Medicago denticulata Willd.

Common Name Family<br>: Rough medik<br>: Fabaceae

H abit: An annual decumbent herb, 20-60cmtall.
Stem: Glabrous or pubescent; branches up to 40 cm long.

Leaves: Leaves 3-foliolate; leaflets obovate to obcordate; terminal leaflets $8-27 \mathrm{~mm}$ long, $7-20 \mathrm{~mm}$ wide, entireor toothed towards apex, sometimes with darker flecks or a basal darker patch; stipules deeply incised, glabrous or hairy on lower surface.

Flowers: Inflorescences 1-3-flowered; peduncle shorter than to twice as long as subtending petiole. Flowersyellow.

Fruits: A pod; spirally coiled two to three turns with two rows of curved prickles along its sharp edges. The pod is about 8 mm in diameter, brown or slightstraw colored.

Seeds: $\quad 1.5 \mathrm{~mm}$ long, 3.0 mm wide, kidney shaped, yellowish or tan, smooth.

## Melilotus alba Medikus.

## Common Name : White sweet clover Family : Fabaceae

Habit: An annual or biennial legume.
Stem: Erect, branching, typically single from base, glabrousorwith afew sparsehairs.

Leaves: Alternate, trifoliolate, stipulate. Stipules linearattenuate, $4-5 \mathrm{~mm}$ long. Leaflets subequal (the terminal slightly larger), oblong to oblongoblanceolate, serrate-dentate, glabrous, up to 3 cmlong, 1 cm broad.

Flowers: Small, white, arranged in many-flowered terminal and axillary racemes.

Fruits: Pod, dark brown to black at maturity, ovoid, $2.5-4 \mathrm{~mm}$ long, withouthairs, and cross-ribbed.

Seeds: $\quad$ 2-2.5 mm long; 1.5 mm wide; oval, one side plane, the other side rounded; yellowish or greenish yellow; smooth.

## M elilotus indica (L.) All.

## Common Name Family <br> : Yellow sweet clover <br> : Fabaceae

Habit: Sweet-smelling, erect herb, up to $10-60 \mathrm{~cm}$ high.

Stem: Hairless, spreading or erect.
Leaves: Odd-1-pinnate; leaflets 1-2.5 cm, inverted lance-shaped to wedge-shaped-obovate, generally sharply toothed on thebroader part.

Flowers: Yellow; appear in slender, compact racemes that are 1-2 inches in length.

Fruits: Pods papery, small, round, 2-3 mm long, yellow or grey, reticulately wrinkled and slightly hairy.

Seeds: $\quad 2$ mmlong; 1.5 mm wide; broadly oval, oneside plane, the other side rounded; yellowishgreen; roughened by minutetubercles

## M elochia corchorifolia L.

## Common Name Family <br> : Chacolate weed <br> : Sterculiaceae

| H abit: | Undershrub, 60 cm tall. |
| :--- | :--- |
| Stem: | Slender, branched, tough-barked, more or less <br> hairy. |
| Leaves: | Variable in shape, ovate-lanceolate, broadest <br> near the base or narrow and parallel-sided, tip <br> pointed or blunt, marginstoothed, moreor less <br> hairy on both surfaces, up to 6 cm long, leaf <br> stalksup to 2.5 cm long. |
| Flowers: | In closeclusters at thebranch ends, mixed with <br> many hairy bristle-like bracts, petals pink, <br> yellow at thebase. |
| Fruits: | Capsule hairy, longer than the sepals, splitting <br> into 5 parts. |
| Seeds: | Ovoid, angular. |

## M erremia aegyptia (Linn.) Urban

## Common Name : Hairy woodrose. <br> Family : Convolvulaceae

| H abit: | Perennial vine. |
| :---: | :---: |
| Stem: | Twining, herbaceous, up to 4 m or more long usually reddish hirsute with long, erect to suberecthairs. |
| Leaves: | Palmately compound with 5 leaflets, which are elliptic, both surfaces sparsely pubescent to glabrate, margins entire to dentate, apex and baseacuminateto acute. |
| Flowers: | Flowers in cymes, usually on long peduncles, pedicels $1-2 \mathrm{~cm}$ long; campanulate, $2-3 \mathrm{~cm}$ long. |
| Fruits: | Capsulestan to palebrown, subglobose, $1-2 \mathrm{~cm}$ in diameter, subtended and partially surrounded by thesomewhat enlarged calyx. |
| Seeds: | Tan, glabrous. |

## M erremia dissecta (Jacq.) Hallier f.

## Common Name : White convolvulus creeper <br> Family : Convolvulaceae

| Habit: | Perenniavine. |
| :--- | :--- |
| Stem: | Hirsutewith yellow-brown hairs. |
| Leaves: | Suborbicular in outline, $5-20 \mathrm{~cm}$ in diameter, <br> palmately divided nearly to base, thelobes 5-9, <br> sinuateto sinuate-dentate. |
| Flowers: | Whitewith a purplecenter. |
| Fruits: | Depressed-globose, $1-2 \mathrm{~cm}$ in diameter, <br> partially surrounded by theaccrescentcalyx. <br> Seeds: <br>  <br> Black, subrounded, glabrous. |

## M erremia emarginata (Burm. f.) H all. f.

## Common Name : Kidney leaf morning glory Family : Convolvulaceae

| H abit: | Prostrate, perennial vine. |
| :--- | :--- |
| Stem: | Much-branched, glabrous or sparsely <br> pubescent, often rootingat thenodes. |
| Leaves: | Reniform to broadly ovate, $0.5-3 \mathrm{~cm}$ long, base <br> cordate with a broadly rounded sinus and <br> rounded basal lobes, obtuse to broadly <br> rounded or emarginated at apex, margins <br> coarsely crenateor entire, glabrous or sparsely <br> appressed pillose. |
| Flowers: | Inflorescences axillary, solitary or in 2-3 <br> flowered cymose groups. Flowers yellow (or <br> pinkish) with a paler tube, campanulate, 5-9 <br> mmlong. |
| Fruits: | Capsular, subglobose, 5-6 mm long, <br> longitudinally sulcate, glabrous, brownish- <br> black orblack. |
| Seeds: | Grayish-brown, glabrous, dotted 2.5 mmlong. |

## M erremia tuberosa (L.) Rendle

| Common Name | $:$ Wood rose |
| :--- | :--- |
| Family | : Convolvulaceae |

Habit: Long, climbingvine.
Stem: Basally woody, perennial, twining, and glabrous.
Leaves: Simpleand theblades arecircular in outline, 6-16 cm long and wide, the base is cordate, and margins are palmately 5-7 lobed almost to the base. The lobes are $8-20 \mathrm{~cm}$ long, $9-20 \mathrm{~cm}$ wide, ovate, $3-9 \mathrm{~cm}$ long, $1-5 \mathrm{~cm}$ wide, and leaf margins areentire.

Flowers: Flowers usually occur in clusters and fully bloom in sunlight and close under cloudy conditions and in the dark. The corolla is yellow, glabrous, funnelform, contortiplicate, enclosed by the sepalsin bud.

Fruits: $\quad$ Globose to depressed globose and $3-3.5 \mathrm{~cm}$ in diameter.

Seeds: Black to dark-brown, ovoid, $1.5-2 \mathrm{~cm}$ long, smooth surfaced, and covered with short, erect, puberulentindumentum.

## Mikania micrantha H.B.K.

## Common Name : Mile a minute <br> Family <br> : Asteraceae

Habit: A creeping perennial.
Stem: Much-branched, scrambling, twining, slendervine; herbaceous to semi-woody, branched, ribbed, sparsely pubescent or glabrous.

Leaves: Simple, opposite, glabrous, thin, broadly ovate, shallowly or coarsely toothed, triangular or ovate, tip acuminate, blade $4-13 \mathrm{~cm}$ long, $2-9 \mathrm{~cm}$ wide, $3-7$ nerved; petioles tendriliform, $2-9 \mathrm{~cm}$ long.

Flowers: Inflorescence a corymbose panicle with subcymose branches, $3-6 \mathrm{~cm}$ long by $3-10 \mathrm{~cm}$ wide; flowers small, white or cream-colored, actinomorphic, $4.5-6 \mathrm{~mm}$ long, in leaf axils or on terminal shoots.

Fruits: Achene; somewhat flattened, elliptic, 4-ribbed with short, white hairs along the ribs, with a tuft of white pappus at the summit, glandular, 1.2-1.8mmlong, dark grey to black.

## Mimosa invisa C. Mart.

## Common Name : Giant sensitive plant Family : Fabaceae

| H abit: | A fast growing, abundantly thorny, biennial or <br> perennial shrub. |
| :--- | :--- |
| Stem: | Bunching, often scrambling over other plants, <br> four-angled, the angles usually with a line of <br> sharp, hooked prickles. . |
| Leaves: | Alternate, bright green, feathery and fern-like, <br> each leaf divided into five to seven pairs of <br> segments. Each segment carries about twenty <br> pairs of very small leaflets which close up <br> when disturbed, injured, or at nightfall. |
| Flowers: $\quad$Very small pale pink flowers occur as round, <br> fluffy balls, about 12 mm across, on short stal ks <br> in theleaf joints. |  |
| Fruits: $\quad$Pods areclustered, each about 25 mm long and <br> 6 mm broad when ripe. Clothed with small <br> prickles, theselater break into four or fiveone- <br> seeded pieces. |  |
| Seeds:2-3.5 mm long; flattened ovate; yellow-brown; <br> glossy; there is horseshoe shaped ring on each <br> face. |  |

## Mimosa pudica L.

Common Name : Sensitive plant<br>Family : Fabaceae

#### Abstract

Habit: A low-growing, much-branched, prickly, sprawling shrub. It grows $15-100 \mathrm{~cm}$ tall and is erect or more generally has a trailing growth habit. Stem: Woody at the base, stiff, cylindrical, reddish-brown or purple, pubescent and bear scattered prickles al ong the internodes. The prickles are 3-4 mm long, compressed, slightly curved, hard and very sharp. Leaves: Dark green, bi pinnate and hairy. Leaflets 12-50, each 612 mm long, 1.5 mm wide, oblong-linear and pointed, glabrous above but with a hairy margin and lower surface. Leaflets and leaves fold up rapidly when touched and al so closeat night.

Flowers: Flowers bright purplish-pink; occur in globular or ovoid heads about 9 mm in diameter.

Fruits: Fruits are bornein clusters in the leaf axils. Each fruit is an oblong, flattened, recurved pod about $8-20 \mathrm{~mm}$ long and $2-6 \mathrm{~mm}$ wide containing 1-5 seeds. The pod is pointed at the apex, glabrous, edged with bristles and breaks into one-seeded segments which fall away from unbroken marginal sutures when mature.

## Mitracarpus Villosus (Sw.) D C.

## Common Name : Tropical girdlepod <br> Family : Rubiaceae

Habit: Anerector spreading annual herb.
Stem: 20-40 cm long, branched or unbranched, pubescent with sort, curly hairs and appressed hairs, al so usually villous on theangles.

Leaves: Elliptic to elliptic-lanceolate, 2-6 cm long, 0.51.5 cm wide, upper surface scabrid to glabrate, lower surface glabrous except puberulent al ong veins and usually scabrid near margins, apex acute, basecuneate, subsessile.

Flowers: Sessile or nearly so, in dense axillary clusters, white, 2-3mmlong.

Fruits: Capsulessubglobose, 1 mmlong.
Seeds: Pale yellowish brown, ellipsoid-rectangular, compressed, 0.8-0.9 mm long, the dorsal face resembling a rectangle with a square portion removed from each corner, ventrally separated into 4 discrete areas by 4 impressed lines
 arising at thehilum.

## Mollugo nudicaulis Lam.

## Common Name : N akedstem carpetweed Family : Molluginaceae

Habit: Annual herb, up to 30 cm tall.
Stem: Weak ascending culms.
Leaves: Basal, $1.5-6.0 \mathrm{~cm}$ long, $6-16 \mathrm{~mm}$ broad, spathulate to oblanceolate, glabrous, attenuate.

Flowers: Inflorescence a dichasium arising from a rosette of basal leaves, spreading; peduncle and pedicel wiry, stiff. Flowers yellowish white.

Fruits: Capsule subovoid or ellipsoid, as long as persistenttepals.

Seeds: Less than 1 mm, muricate, minutely strophiolate, black and shiny.

## M ollugo pentaphylla L.

## Common Name : Five leaved carpetweed <br> Family : Molluginaceae

| H abit: | A slender, decumbent to erect, usually annual <br> herb, up to 30 cmtall. |
| :--- | :--- |
| Stem: | Much branched, angular. |
| Leaves: | $1.3-3.7 \mathrm{~cm}$ long and $0.3-1.8 \mathrm{~cm}$ wide, in whorls <br> of $2-9$, linear lanceolate to obovate, apex <br> obtuse, acute or apiculate, narrowed at the <br> base; petiolesobscure. |
| Flowers: | White, greenish, orange or pink in lax, <br> corymbose, terminal cymes; peduncles and <br> pedicelsfiliform. |
| Fruits: | Capsule subglobose, about as long as sepals, <br> withthin walls. |
| Seeds: | Dark reddish-brown, covered with raised <br> points. |

## M onochoria vaginalis (Burm f.) K unth.

## Common Name : Heart shape false pickerel weed Family : Pontederiaceae

| H abit: | A fleshy, tufted, annual or perennial aquatic herb with a glabrous, shiny appearance; 10-50 cmtall. |
| :---: | :---: |
| Stem: | A shortrhizome. |
| Leaves: | Size and shape is highly variable. In young plants without lamina, the leaves are 2-12.5 cm long and $0.5-10 \mathrm{~cm}$ wide. In somewhat older plants, the leaves are floating, linear or lanceol ate and in still older plants, are ovate-oblong to broadly ovate, sharply acuminatewith a heart-shaped or rounded base, shiny, deep-green, and with longitudinal veins. Thepetioles aresoft and hollow. |
| Flowers: | Inflorescence is spicate, 3-6 cm long, basally opposite the sheath of the floral leaf with a large bract arising from a thickened bundle on the leaf stalk, about two-thirds of theway up thestalk from the base. The flowers are pedicelled, bisexual, lilac or violet colored. |
| Fruits: | Capsule, 1 cm in size, splits between the partitions intothreevalves. |
| Seeds: | Longitudinally ribbed. |

## Mukia maderaspatana (L.) Roem.

## Common Name : M adras pea pumpkin Family : Cucurbitaceae

H abit: | A prostrate or climbing, much-branched, |
| :--- |
| annual herb. |

Stem: | Strongly hispid-scabrid with spreading bristly |
| :--- |
| hairsand simpletendrils. |

Leaves: | Alternate, broadly triangular in outline, 5- |
| :--- |
| angled or 3-5 lobed, 3-11 cm long and wide, |
| apex acute, base deeply cordate, margins |
| shortly, irregularly dentate, dark green and |
| scabrid above, paler green and hispid beneath. |

Flowers: | Small, pale yellow; male flowers fascicled on |
| :--- |
| very short peduncles, female flowers usually |
| solitary, sessile. |

Fruits: | Berry globose-ellipsoid, up to 1.5 cm in |
| :--- |
| diameter, pale green with longitudinal cream |
| stripes, ripening scarlet. |

Seeds: | Up to 4 mm long and 2 mm broad, closely |
| :--- |
| arranged, compressed, ellipsoid, grey. |

 arranged, compressed, ellipsoid, grey.

## M urdannia nudiflora (L.) Brenam.

## Common Name : Naked stem dewflower <br> Family : Commelinaceae

| H abit: | An annual herb, $8-30 \mathrm{~cm}$ high. |
| :--- | :--- |
| Stem: | Unbranched to many branched, creeping, <br> ultimatebranches ascending. |
| Leaves: | Spirally arranged; leaf sheaths with long <br> shaggy hairs. Leavesoblong-lanceol ate, acute. |
| Flowers: | Inflorescenceterminal or terminal and axillary; <br> cymefew-flowered, solitary or fascicled, long- <br> pedunculate; flowers pinkish purple or violet, <br> 3-6mm. |
| Fruits: | Capsulesglobose, $2.5-5 \mathrm{~mm}$. |
| Seeds: | Deeply pitted, 1.3--1.8mm. |

## O Idenlandia corymbosa L.

## Common Name : Diamond flower <br> Family : Rubiaceae

Habit: An annual herb.
Stem: Ascending or erect;4-angled.
Leaves: Linear-oblong or narrowly elliptic, almost stalkless; 1-3.5 cm long and $1.5-7 \mathrm{~mm}$ wide. Midrib of theleaf is prominently visible.

Flowers: White or faintly pinkish-purplish, on slender stalks4-8mmlong.

Fruits: Capsule is about $2 \times 2 \mathrm{~mm}$, flattened at apex, slightly laterally compressed.

## Oldenlandia diffusa (Willd.) Roxb.

## Common Name : Snake needle grass <br> Family : Rubiaceae

| H abit: | An annual herb, up to 0.3mhigh. |
| :--- | :--- |
| Stem: | Slender, low lying. |
| Leaves: | $1-3.5 \mathrm{~cm}$ long, 1.5-3mmwide. |
| Flowers: | White, 2mmacross. |
| Fruits: | Capsule globose, 1-1.5 mm across, slightly <br> laterally compressed. |

## O Idenlandia herbacea (L.) Roxb.

## Common Name : Slender oldenlandia Family : Rubiaceae

H abit: Annual or perennial herb.
Stem: Much-branched wiry stems, often intertwined.

Leaves: Small,linear-lanceolate.
Flowers: Solitary or in pairs on long stalks, axillary at the nodes, up to 5 mm in diameter, white or mauve.

Fruits: Small, round capsules.

## O perculina turpethum (L.) Silva M anso.

Common Name : Indian jalap<br>Family : Convolvulaceae

| Habit: | An extensiveperennial vine. |
| :---: | :---: |
| Stem: | Usually angled or narrowly 3-5-winged; fleshy with milky juice. |
| Leaves: | Variable in shape, orbicular, broadly ovate, ovate-lanceolate or lanceolate, 5-15 cm long, base cordate to hastate, apex acuminate, acute or more commonly coarsely dentate to shallowly lobed, upper surfaces glabrous or appressed-pilose, lower surfaces pubescent. |
| Flowers: | Inflorescence axillary, cymosely one or few flowered. Flowers with peduncles, $0.2-1.8 \mathrm{~cm}$ long, glabrous or pubescent; white or white with a yellowish base, campanulate to broadly funnel-shaped. |
| Fruits: | Capsular, depressed-globose, 1.5 cm long, enclosed in theenlarged, papery sepals. |
| Seeds: | Dull black, glabrous, 6 mmlong. |

## O plismenus burmannii (Retz.) P.Beauv

## Common Name : Wavy leaf basketgrass Family : Poaceae

H abit: An annual grass; 10-60cmtall.
Stem: Culms prostrate; mid-culmnodesglabrous.
Leaves: Leaf-bladeslanceolateor ovate, 1-10cmlong, 520 mm wide. Leaf-bladevenation with obscure crossnerves; surfacesmooth.

Flowers: Inflorescencecompound, a panicleof racemes.
Fruits: The shortly pedicellate spikelets consist of two awned glumes, a lower floret that is sterile or staminate and usually has an awned lemma but no palea, and an upper floret that is enclosed by theupper lemma and palea.

## Oxalis corniculata L.

## Common Name : Creeping wood sorrel Family : Oxalidaceae

| H abit: | A small annual or perennial, procumbent or <br> moreor lesserect herb, $6-25 \mathrm{~cm}$ high. |
| :--- | :--- |
| Stem: | Pubescentwith appressed hairs. |
| Leaves: | Palmately trifoliate; leaflets $1.2-2.5 \mathrm{~cm}$ long, <br> obcordate, base cuneate, margins entire; <br> petioles 3.5-9cmlong, very slender, pubescent. |
| Flowers: | Yellow, axillary in umbellate clusters on <br> slender axillary peduncles. |
| Fruits: | Capsules 2 cm long, linear-oblong, 5-angles, <br> tomentose. |
| Seeds: | Dark brown, broadly ovoid, transversely <br> striate. |

## Oxlis martiana Zucc.

## Common Name : Lilac oxalis Family : Oxalidaceae

## Parthenium hysterophorus L.

Common Name : Congress grass<br>Family : Asteraceae

Habit:
A short-lived annual herb with an extensive rootsystem and an erect shoot; up to 2 mhigh .

Stem: Erect main stem, upper half of the main stem becomes highly-branched at flowering; stems appear to be striped due to longitudinal grooves or ribs and they become woody with age.

Leaves: Palegreen, deeply lobed and covered with fine softhairs.

Flowers: Creamy-white flowers occur at the tips of the stems. Clusters of male and female florets are grouped as five-lobed flowers on the terminal branches of the flower stem and measure 4-6 mmin diameter.

Fruits: Achene small (1-2 mm across), flattened, triangular and dark brown-black with two thin, white, spoon-shaped appendages.

## Paspalidium flavidum (Retz.) A. Camus.

Common Name : Yellow Watercrown G rass<br>Family : Poaceae

| Habit: | A perennial grass, characterized by spikes separated by 2-4 times their length, and spikelets (especially in fruit) spherical. |
| :---: | :---: |
| Stem: | Culms are tufted, slightly compressed, 1-3 ft tall from a prostratebase. |
| Leaves: | Leaf sheaths are strongly keeled, smooth Leaves are linear-lanceshaped, flat or folded, $5-30 \mathrm{~cm}$ long, $0.5-1 \mathrm{~cm}$ broad. Liguleis about 0.5 mm . |
| Flowers: | Inflorescence axis is $5-20 \mathrm{~cm}$. Flower racemes are 6-9, $1.5-2.5 \mathrm{~cm}$ long, widely spaced. Rachis is about 0.5 mm wide, slightly winged, prolonged into a point. |
| Fruits: | Spikelets are ovate, gibbous, $1.5-2.5 \mathrm{~mm}$, milk whiteor purplish. |

## Paspalum dilatatum Poir.

## Common Name : Dallis grass <br> Family : Poaceae

| Habit: | A tufted perennial (living for longer than 1 <br> growing season) up to about 2 mhigh. |
| :--- | :--- |
| Stem: $\quad$Tall, erect, growing from a solid, hairy base or <br> crown. |  |
| Leaves:Lower sheaths of leaves are hairy. The leaf <br> blade is angled al ong the midrib, and is long <br> and narrow, bright green, sparsely long-hairy <br> around whereitmeetsthestem. |  |
| Seeds: $\quad$Inflorescence usually has 3 to 7 spike-like <br> racemes but could be up to 11. Each raceme is <br> usually less than 5 cm long (but can beup to 12 <br> cm long) and usually at almost right-angles <br> fromthestem. |  |
| Seed heads have paired seeds lined up in 4 <br> rows. Seeds are brown when mature and <br> fringed withfinehairsand may feel sticky. |  |

## Paspalum distichum L.

## Common Name : Knot grass <br> Family <br> : Poaceae

Habit: An perennial grass, growsup to 60 cm long.
Stem: Round in cross-section and stems range from erectto prostratewith erecttips.

Leaves: Flat, often keeled at the base, and hairless except for a few long hairs at the base. Sheaths are open and usually are covered with long hairs. Leaves arerolled in thebud.

Flowers: The flower head is "V"-shaped, formed by two (sometimes three) branches. The main flowering stem can be up to 15 cm long. The branches grow fromabout 1-6cmlong.

Fruits: Spikelets usually solitary on the pedicels, occasionally binate near the middle of the raceme, imbricate, $2.5-3.5 \mathrm{~mm}$ long, widely
 elliptic, abruptly acute, palegreenish.

## Passiflora foetida L.

## Common Name : Wild water Iemon Family : Passifloraceae

| H abit: | A perennial vinethat climbswithtendrils. |
| :--- | :--- |
| Stem: | Thin and wiry, covered with minute sticky <br> yellow hairs. Olderstems becomewoody. |
| Leaves: | Three to five-lobed and viscid-hairy. When <br> crushed, these leaves give off a pungent odor <br> that somepeopleconsider unpleasant. |
| Flowers: | White to pale cream coloured, about 5-6 cm <br> diameter. |
| Fruits: | Globose, 2-3cm diameter, yellowish-orangeto <br> red when ripe. |
| Seeds: | Black seedsembedded in thepulp. |

## Pedalium murex Linn.

## Common Name : Large caltrops <br> Family : Pedaliaceae

Habit: A shrubby, stiff-stemmed, succulent herb growsup to 40 cm in height.

Stem: Much branched, spreading, succulent, glandular.

Leaves: Simple, opposite, ovate or oblong-obovate, 14.5 cm long, irregularly and coarsely crenateserrate.

Flowers: Brightyellow, solitary and axillary.
Fruits: 4 angled with horizontal spines from the angles.

## Pergularia daemia (Forssk.) Choiv.

Common Name : Pergularia<br>Family : Asclepiadaceae

| H abit: | A perennial twining herb. |
| :--- | :--- |
| Stem: | Upto4mormore, covered in softhairs. |
| Leaves: | Thin, broadly ovate, heart-shaped or nearly <br> circular, hairlessabove, velvety beneath. |
| Flowers: | Greenish yellow or dull white, and sweet- <br> scented, borne in lateral cymes which are at <br> firstcorymb-like, afterwardsraceme-like. |
| Fruits: | A follicle, with soft spines all over and a long <br> beak. |
| Seeds: | Densely velvety on both sides. |

## Peristrophe paniculata (Forssk.) Brummit.

## Common Name : Panicled peristrophe <br> Family <br> : Acanthaceae

## Phalaris minor Retz.

## Common Name : Little seed canary grass Family : Poaceae

H abit: A tufted annual bunchgrass, up to 1.8metres in height.

Stem: Erect or decumbent, caespitose.
Leaves: Leaves long, linear, acuminate. Ligule is an oblong hyal inemembrane, about2-5mm long, often truncateand/ or fringed; auricles absent, sheath smooth.

Flowers: Panicle more or less protruding or entirely protruding from the uppermost swollen leaf sheath, ovate to oblong, 5-8 cm long, green. Sikelets green, broadly lanceolate on short pedicels, shining, 4-6 mm long, strongly laterally compressed.

## Phaseolus trilobus auct.

## Common Name : Jungle mat bean Family : Fabaceae

H abit: An annual or perennial legume.
Stem: Branches prostrate, diffuse, trailing, glabrous or pubescent. Stipules peltate, sometimes spurred, ovate, 4to 15 mm long.

Leaves: Trifoliate. Petiole 3.7 to 7.5 cm long. Leaflets 1.2 to 2.5 cm long, usually as wide, generally three lobed, lobes simple, various, oblong obtuse or subacute, glabrousto subglabrous.

Flowers: Inflorescence a few-flowered raceme; flowers yellow.

Fruits: Pods cylindrical, 2.5 to $5.0 \times 3 \mathrm{~mm}$, glabrous to sparingly pubescent, 6 - to 12 -seeded.

Seeds: Dark reddish brown ,often greenish brown, with black patches.

## Phyla nodiflora (L.) G reene.

## Common Name : Texas frogfruit <br> Family : Verbenaceae

H abit: A creeping annual herb.
Stem: Often rooting at thenodes, with numeroussubquadrangular branches.

Leaves: Opposite, subsessile, $2-3.2 \mathrm{~cm}$ long and 1-2 cm wide, spathulate or obovate, base cuneate, apex rounded, margins sharply serrate near the apex, appressedly hairy on both sides with whitehairs.

Flowers: Sessile, densely packed in long pedunculate axillary heads that are at first globose, becoming elongate and spicate in fruits; white or palepink..

Fruits: Globose-oblong, $1.5-2 \mathrm{~mm}$ in diameter, dry, splitting into two 1-seeded glabrous convex
 pyrenes.

## Phyllanthus madraspatensis L.

Common Name : M adras leaf-flower<br>Family : Euphorbiaceae

| Habit: | An erect or spreading subshrub, growing to only 50 cm tall. |
| :---: | :---: |
| Stem: | Well-branched and hairless. |
| Leaves: | Inverted lance-shaped or obovate, $1-4 \mathrm{~cm}$ long, up to 5 mm wide. Underside is glaucous, tip is blunt or rounded with a sharp point. Stipules havewhitemargins. |
| Flowers: | M aleflowers arise2or 3together with 1 female Female flower petals are obovate with white margins, 2 mm long and 1.5 mm wide, twice thesizeof themalepetals. |
| Fruits: | Capsule is about 3 mm in diameter, globose, dry. |
| Seeds: | $1.3 \times 1 \times 1 \mathrm{~mm}$, brown with 14 rows of shiny black tubercles on the back, and 11-12 concentricrings of tubercles on thesides. |

## Phyllanthus multiflorus Willd.

Common Name Family<br>: Phyllanthus<br>: Euphorbiaceae

H abit: A small spreadingshrub, up to 5mtall .
Stem: Up to 15 cm in diameter, bark rough, brown to grey, branchletsslender.

Leaves: Differently shaped; spirally arrange, 1.5 mm long on the orthotropic shoots; plagiotropic shoots with normally developed, distichous, elliptic to obovate leaves, $1-5 \mathrm{~cm} \times 0.5-2.5 \mathrm{~cm}$, entire, cuneate to rounded at base, obtuse to emarginate at apex, glabrous and shortly petiolate.

Flowers: In few-flowered fascicles or solitary in leaf axils, unisexual, often a single female flower and some male flowers together, sometimes arranged on leafless shoots and those then seemingly long racemes.

Fruits: A depressed-globose berry, up to 7 mm in diameter, usually blueish-black when ripe with dark purplish pulp.

Seeds: Trigonous, up to 2 mmlong, blackish.

## Phyllanthus niruri L.

## Common Name : Stonebreaker <br> Family : Euphorbiaceae

## Phyllanthus urinaria L.

## Common Name : Chamber bitter <br> Family : Euphorbiaceae

H abit: An erect or subscandent annual herb, up to $1 m$ high.

Stem: Erectand red.

Leaves: Small, green, oblong, feathered, Iarge at the tip and smaller towards the petiole. When the plant is picked the feathery leaves fold in, completely closing themselves.

Flowers: Greenish white, minute and appear at axils of theleaves.

Fruits: Small green-red fruits, round and smooth, are born along theundersideof thestems.

Seeds: Yellowish brown to dark brown, wedge shaped, transversely ribbed on theback.

## Phyllanthus virgatus Forst.

## Common Name : Narrow piss weed Family : Euphorbiaceae

## Physalis minima L.

## Common Name : Sunberry <br> Family <br> : Solanaceae

| Habit: | A fairly low-growing annual, usually up to 1-3ft. |
| :---: | :---: |
| Stem: | Erect, deli cateand pubescent. |
| Leaves: | Petiolate ( 4.1 cm long), ovate to cordate, pubescent, delicate, exstipulate, acuminate, having reticulate-palmate venation and undulate margins; dorsal surface of the leaves, dark green and the ventral surface, light green; 9.7 cm long and 8.1 cm broad. |
| Flowers: | Pedicellate having 1.2 cm long pedicel, hermaphrodite, complete, solitary, smal companulate, 1.2 to 1.4 cm in diameter; yellow, having five black spots on yellow ground in the middleof thecorollacup. |
| Fruits: | A berry, enclosed within theenlarged, 10-ribbed, reticulately veined calyx, which is 4.1 cm long and 2.5 cm broad; berries, stalked (stalk, 2.2 cm long), almost round having a pinhead-sized depression at the end; fully mature fruits primroseyellow. |
| Seeds: | Globose, fla |

## Physalis peruviana L.

## Common Name : Cape goose berry <br> Family : Solanaceae

| H abit: | Herbaceous or soft-wooded, perennial plant, usually reaches $1.6-0.9 \mathrm{~m}$ in height but occasionally may attain 1.8 m . |
| :---: | :---: |
| Stem: | Angular, ribbed, thickened above the node, moreor lessdensely hairy. |
| Leaves: | Nearly opposite, velvety, heart-shaped pointed, randomly-toothed leaves $6-15 \mathrm{~cm}$ long and $4-10 \mathrm{~cm}$ wide. |
| Flowers: | Bell-shaped, nodding flowers, 2 cm wide, yellow with 5 dark purple-brown spots in the throat, and cupped by a purplish-green, hai ry, 5-pointed calyx. |
| Fruits: | Berry is globose, $1.25-2 \mathrm{~cm}$ wide, with smooth, glossy, orange-yellow skin with in the calyx cup. |
| Seeds: | Pale brown, discoid, 1.75 to 2 mm long, minutely shallowly reticulate. |

## Pluchea Ianceolata (D C.) Oliv. \& Hiern.

## Common Name : Indian camphorweed Family : Asteraceae

H abit: A stoutherb growing 0.33-2minheight.
Stem: Grooved, rough and very hairy.
Leaves: Elliptical, large, $3-6 \mathrm{~cm}$ long and $2-3 \mathrm{~cm}$ broad, and havelong petioles.

Flowers: Yellow or light pinkish, many in heads, 0.5-1 cmin diameter.

Fruits: $\quad$ Slender achene, 0.4 cm long, bearded with 0.75 cmlong pappushairs.

## Plumbago zeylanica L.

## Common Name : Ceylon leadwort Family : Plumbaginaceae

Habit: A herbaceousperennial.
Stem: Climbing, prostrate, or erect, glabrous.
Leaves: Petiolate or sessile and have ovate, Ianceelliptic, or spatulateto oblanceolateblades that measure5-9×2.5-4cm in length.

Flowers: Whitein showy denseracemes.
Fruits: Capsules are $7.5-8 \mathrm{~mm}$ long, like a small cocklebur with glueon the soft spines and they will stick to anything.

Seeds: Reddish brownto dark brown.

## Polygonum plebeium R. Br.

## Common Name : Small knotweed Family : Polygonaceae

H abit: A prostrate, densely branched, annual herb.
Stem: Branched from base, branchesnumerous.

Leaves: Lance-like, elliptic, stalkless, 1.0-3.0 x 0.1-0.4 cm , entire. Ochrea are 1-2 mm long, membranous, ovate, tube-shaped.

Flowers: Inflorescence axillary, 3-4 flowered. Flowers sunken between ochrea or hardly coming out, 1-2 mmacross, nearly stalkless; pinkish red.

Fruits: Nuts 1.0-1.75 mm long, circular to ovate, shining, black, glabrous.

## Polypogon monspeliensis (L.) Desf.

Common Name : Annual rabbitsfoot grass<br>Family : Poaceae

Habit: An annual grass.
Culm: $\quad 15-100 \mathrm{~cm}$ long, weak, erect to geniculate, decumbent at base. Herbage glabrous to scabrous; culms branched to unbranched.

Leaves: Leaf blades flat, linear, 1.5-22 cm or more long, $1.1-10 \mathrm{~mm}$ or more wide, scabrous, margins scabrous, apices acute. Basal leaf sheaths terete, minutely scabrous to glabrous; sheaths open, loosely enclosing culm. Ligule membranous to chartaceous, $1.7-6 \mathrm{~mm}$ or more long, smooth, acute to truncate, irregularly dentate, minutely hairy. No auricles present.

Flowers: Inflorescence a terminal panicle, very dense and spike-like, occasionally with short, dense branches below, bristly with tawny, yellowish awns; ovoid-cylindricto cylindric, symmetrical.

Fruits: Caryopsisfreefrom lemma and palea, elliptical, terete, $0.9-1.2 \mathrm{~mm}$ long, $0.5-0.6 \mathrm{~mm}$ wide, glabrous, amber colored.

## Portulaca oleracea L.

## Common Name : Common purslane Family : Portulacaceae

Habit: An annual glabrousherb.
Stem: Prostrate, succulent; trichomes at nodes.
Leaves: Obovate or spatulate, flattened, $4-28 \times 2-13$ mm , apex round to retuse or nearly truncate; involucrelikeleaves 1-4.

Flowers: 3-10mmdiameter; yellow.
Fruits: Capsulesovoid,4-9mm diameter.
Seeds: Black or dark brown, orbiculate or elongate, flattened, 0.6-1.1 mm; surface cells sooth, granular, or stellate, with rounded tubercles.

## Portulaca quadrifida L.

## Common Name : Chickenweed <br> Family : Portulacaceae

Habit: An annual herb.
Stem: Articulated, prostrate, somewhat fleshy, rooting at nodes; branchesfiliform.

Leaves: Opposite; petiole absent; leaf blade flat, ovate, obovate, or ovate-elliptic, $4-8 \times 2-5 \mathrm{~mm}$, slightly narrowed toward base, apex obtuseor acute.

Flowers: Flowers solitary, surrounded by involucre of 4 or 5bracts, whitepilose; yellow.

Fruits: Capsule 3.5- 4.5 mm long, $2.5-3 \mathrm{~mm}$ in diameter, oblong-conical.

Seeds: Black, 1 mm across, reniform, somewhat papillose.

## Pouzolzia zeylanica (L.) Bennett \& R. Br.

## Common Name : G raceful pouzolzs bush Family : Urticaceae

## Pseudognaphalium Iuteo-album (L.) Hillard \& Burtt.

Common Name : Cottonweed<br>Family : Asteraceae

Habit: An annual herb.
Stem: Loosely white-tomentose, not glandular.
Leaves: Narrowly obovate to subspatulate; margins weakly revolute, faces mostly concolor to weakly bicolor, abaxial gray-tomentose, adaxial usually gray-tomentose,

Flowers: Heads in terminal glomerules,1-2cm diameter; silvery gray to yellowish.

Fruits: Cypselae conspicuously dotted with whitish, papilliform hairs; pappus bristles loosely coherent basally.

## Psoralea corylifolia L.

Common Name : Babchi<br>Family : Fabaceae

H abit: An annual herb.
Stem: 0.6-1.2m.High; grooved.
Leaves: Simple, $3.8 \times 2.5-5.0 \mathrm{~cm}$, broadly elliptic, incisodentate, rounded and mucronate at apex, white hairy, nigro-punctate, petioles hairy and gland dotted.

Flowers: In dense axillary, solitary, 10-30 flowered racemes; Corolla bluish purple, standard orbicular, clawed.

Fruits: Pod, ovoid-oblong, closely pitted, mucronate, black.

Seeds: The seeds are dark brown, elongated, glabrous, closely pitted.

## Rhynchosia minima (L.) DC.

Common Name : Least snout-Bean<br>Family : Fabaceae

Habit: Prostrateor twining perennial, herb or climber.
Stem: $\quad 0.15-3 m$ high; smooth or velvety.
Leaves: Trifolitae, with 3 rhombic, ovate, or nearly circular leaflets. Thelateral leaflets are oblique. Leaflets are $1-6 \mathrm{~cm}$ long, $0.8-5 \mathrm{~cm}$ wide.

Flowers: Flowers are borne in loose racemes, 2-15 cm long, in leaf axils. Flowers are brownish outside, and yellow inside. The standard petal is often tinged reddish.

Fruits: Pods are oblong-curved, flattened, shortly beaked and slightly constricted between the widely spaced seeds, $0.6-3.5 \mathrm{~cm}$ long, 0.3-0.5 cm wide,black when ripe.

Seeds: Monocoloured, black or brown, 3 mm long, with a shorthilus.

## R ottboellia cochinchinensis (Lour.) W.D . Clayton

Common Name : Itchgrass<br>Family<br>: Poaceae

Habit: Anerectannual grass.
Stem: Up to 4 metres tall, erect, profusely tillering, roots near the base of the plant. Stems and leaves arecovered with stiff, irritatinghairs.

Leaves: Leaf blades are $15-45 \mathrm{~cm}$ long, $5-20 \mathrm{~mm}$ wide and flat; characterized by pale, green-col our.

Flowers: Inflorescence is a cylindrical raceme that is $3-15 \mathrm{~cm}$ long. Thefloral units consist of a sessile spikelet, pedicellate spikelet and internode. The pedicel is fused to the swollen floral internode. The spikelets are awnless, $3.5-6 \mathrm{~mm}$ long, and $2.5-3 \mathrm{~mm}$ wide. Thefloral units separate and fall as soon as they mature, from thetop of theracemedownwards.

Fruits: Caryopsis oblong-ovate, gibbous, 3-4 mm long, 2-2.2mmwide.

## Ruellia prostrata Poir.

## Common Name : Prostrate wild petunia Family : A canthaceae

Habit: A prostrateperennial herb.
Stem: Straggling, much branched; it is purple at the nodes; internodes arelongand hairy.

Leaves: Ovate or elliptic, accute, hairy, entire, with narrow base.

Flowers: Nearly sessile, axillary, solitary or few together. Pale blue to light violet and occasionally whitein color.

Fruits: $\quad$ Capsules club-shaped, $1.5-2 \mathrm{~cm}$ long, densely covered with finehairs.

## Ruellia tuberosa L.

## Common Name : Snapdragon root Family : Acanthaceae

| Habit: | An annual or bienniaherb. |
| :--- | :--- |
| Stem: | Erect, 50 cm tall, widely branched, with <br> fusiform tuberous roots. |
| Leaves: | Mostly basal, finely pubescent; blades ovate to <br> oblong, $4-6 \times 1.5-2.5 \mathrm{~cm}$, base cuneate, apex <br> obtuse, margin undulate. |
| Flowers: | Cymesdichotomous, few-flowered; purple. |
| Fruits: | Capsule subcylindrical, 1.5 cm long, <br> puberulent. |
| Seeds: $\quad$ Orbicular; $2-2.5$ mmindiameter. |  |

## Rumex dentatus L .

## Common Name : Toothed dock <br> Family : Plygonaceae

Habit: An annual or biennial herb.
Stem: Erect, often flexuous in inflorescence, branched, distal to middle, occasionally almost from base, 20-80 cm tall.

Leaves: Ocrea deciduous or partially persistent at maturity; blade oblong, elliptic-lanceolate, or ovate-elliptic, 3-12 $\times 2-5 \mathrm{~cm}$, base normally truncate or subcordate to weakly cordate, margins entire, flat to weakly undulate, occasionally slightly crisped, apex obtuse or subacute.

Flowers: Inflorescences terminal, occupying distal half of stem, usually lax and interrupted, broadly paniculate, branches usually ascending and straight. Flowers 10-20 in rather dense remote whorls.

Fruits: $\quad$ Achenes dark reddish brown, 2-2.8×1.4-1.8
 mm .

## Rungia pectinata (L.) Nees.

## Common Name : Comb rungia <br> Family : Acanthaceae

## Rungia repens Nees.

## Common Name : Creeping rungia Family : A canthaceae

Habit: Anerector sub-erect annual herb.
Stem: Slender, often rooting at the base, subterete, glabrousor puberulous.

Leaves: $\quad 2.5-5 \mathrm{~cm}$ long, elliptic-lanceolate, oblong, subsessile.

Flowers: In erect, terminal spikes; white, blue or pink with darker spots.

Fruits: Capsule acute with scarious faces and hard edges.

Seeds: Sub-orbicular, rugosewith concentric furrows; palebrown.

## Saccharum spontaneum L.

## Common Name : Wild sugarcane Family : Poaceae

Habit: Strong perennial.
Culm: 1-2 m tall, tufted; solid above, fistular below, polished, silky below panicles and minutely silky below upper leaf-insertions.

Leaves: Erect, glaucous, midrib white, marginsscabrid, often villous above base, sheath longer than internode.

Flowers: Panicle conical-oblong, with 3-15 cm long fragile racemes, joints and pedicels; branches ascending, usually reddish or purplish, primary rachissilky with long, whitehairs.

Fruits: Caryopsis2mmlong, oblong.

## Sacciolepis indica (L.)

## Common Name : Glenwood grass <br> Family : Poaceae

| H abit: | Annual or perennial, more or less weakly <br> rhizomatous. |
| :--- | :--- |
| Stem: | Culms tufted, decumbent, branching from <br> base, $15-50 \mathrm{~cm}$ long, slender, glabrous. |
| Leaves: | Usually near base of culm; sheaths glabrous, <br> shorter than internodes; ligule membranous, <br> $0.1-0.3 \mathrm{~mm}$ long; blades 3-10 cm long, 2-4 mm <br> wide, glabrous. |
| Flowers: $\quad$Inflorescences 1.5-7cm long, usually lessthan 5 <br> mmin diameter, often tinged purple, peduncle <br> slender, 10-23cm long, often constituting more <br> than; theheight oftheplant; |  |
| Fruits:Spikelets pedicellate, strongly imbricate and <br> concealing the rachis; first glume ovate, boat- <br> shaped, $1.1-1.5$ mm long, 5-nerved, second <br> glumeboat-shaped, 2.5-2.8mmlong. |  |
| Seeds: | Caryopsis brown, ovoid, slightly compressed, <br> 1mmlong. |

## Sagittaria guyanensis Kunth.

## Common Name : Guyanese arrowhead Family : Alismataceae

Habit: It isalactiferousherbwithoutstolons.
Stem: $10-80 \mathrm{~cm}$ high.
Leaves: The leaves are floating and simple, the margin entire, broadly arrow-head shaped and oval in outline, and $3-12 \times 2.5-11 \mathrm{~cm}$. The leaf tip is obtuse-rounded, and thebaseis deeply cordate and sagittate with two broad diverging lobes; the petiole is usually about $15-30 \mathrm{~cm}$ long, septate, with air-ducts; the basal part has a broad, membranoussheath.

Flowers: The inflorescence is a raceme; the peduncle is flaccid, $10-30 \mathrm{~cm}$ long, with several whorls of flowers attached to the main axis. Flowers are mainly unisexual; bisexual flowers are usually in lower whorls.

Fruits: Fruit is a nodding aggregate on a strongly thickened pedicel. The fruit aggregate is about $10-15 \mathrm{~mm}$ in diameter.

Seeds: The seeds are brown, 1.5 mm long; the exocarp has ablunt, broad spiny crest.

## Salvinia molesta MitchelI.

Common Name : Water fern<br>Family : Salviniaceae

Habit: A rootless, aquaticfern.
Fronds: Emergent groups of leaves (fronds) grow in pairs and are approximately $1 / 2$ inches wide and 1 inch long. A brown, thread-like leaf hangs underwater; all join at a node along a horizontal, underwater stem. The upper surfaceof thegreen leaves is covered with rows of white, coarse hairs, acting as a water repellent.

Propagation: It grows from fragmentsthat have broken off or dormant buds that have been detached from the main plant. Each node has five buds so potential for great \& rapid spread. It also produces spores but they are genetically defectiveand do not produceviableoffspring.

## Scoparia dulcis L.

## Common Name : Licorice weed <br> Family : Scrophulariaceae

Habit: Anerect perennial herb.
Stem : Up to 90 cm tall; stem 5-6-angled, glabrous; divari cately branched, fetid smelling.

Leaves: Leaves oppositeor in whorls of 3, oblong-ovate to oblanceol ate, $0.5-3.8 \mathrm{~cm}$ long and $0.8-1.5 \mathrm{~cm}$ wide, tapering at base, subacute at apex, margins entire or coarsely crenate-serrate, glabrous on both surfaces.

Flowers: Flowers small, borne in small, 2-6-flowered axillary whorls in slender pedicels, $8-13 \mathrm{~mm}$ long; corolla white, 0.5 cm in diameter.

Fruits: Capsulesubglobose, 3-4mm in diameter.

## Sebastiana chamaelea (Linn.) M uell.

## Common Name: Snake's tongue <br> Family : Euphorbiaceae

Habit: A slightly woody herb, annual or perhaps lasting over oneyear.

Stem: About 60 cm high.
Leaves: Alternate, thick-papery, linear or linearlanceshaped, 2-5.5cm long, 2-10 mm wide, tip blunt, margins densely toothed, usually with glands. Midrib is prominent on both surfaces.

Flowers: Flowers appear in 5-12 mm long spikes, laterally or at theend of branches. Maleflowers are numerous, spirally arranged at upper part of inflorescence axis, female ones 1 or several inserted at lower part of inflorescenceaxis.

Fruits: Capsules are triangular-spherical, 3-4 mm in diameter.

## Setaria glauca (L.) P. Beauv.

Common Name : Yellow foxtail Family : Poaceae

Habit: An annual grass.
Stem: Stems are erect, often flattened, without hairs (glabrous), reaching 3 feet in height, and often with a reddishtintatthebase.

Leaves: Leaf blades may reach 12 inches in length and 7 to 12 mm in width, and havelong silky hairs at theleaf bases. A uricles areabsent and theligule is afringeof hairs reaching 2 mm in length.

Flowers: The seed head is a cylindrical bristly panicle, reaching 6 inches in length and 1/ 3-2/ 3inch in width. Spikelets areapproximately 3 mm long, green, and each spikelet has 1-3 bristles that are 5-10 mm long. The bristles turn yellow at maturity, giving theplantit's name.

Seeds: More prominently cross-ridged, and yellowish or straw-coloured.

## Setaria viridis (L.) P. Beauv.

Common Name : G reen foxtail Family : Poaceae

Habit: An annual grass.
Stem: Erect or spreading, $10-100 \mathrm{~cm}$ tall or occasionally taller, usually round in crosssection but occasionally much flattened.

Leaves: Leaves and leaf sheaths of very young plants often densely hairy but with upward-pointing hair; upper leaf blades and leaf sheaths mostly without hair; margins and both surfaces of leaf blades rough with very fine forward-pointing barbs; leaf sheath split with overlapping margins, both margins being fringed with a band of shorthair.

Flowers: Very densespike; $1-15 \mathrm{~cm}$ long and $0.6-2.0 \mathrm{~cm}$ wide, usually straight and erect or rarely somewhat curved, the larger ones sometimes with short branches up to 1 cm long, and covered with short green to slightly purplish bristles which give the inflorescence a bottlebrush appearance.

Seeds: Rounded on one surface but flattened on the
 other, finely cross-ridged, and dull yellowishgreen with brownish spots.

## Sida acuta Burm. f.

## Common Name : Common wireweed <br> Family <br> : Malvaceae

H abit: A shrubby annual or perennial herb.
Stem: Up to 1.5 m tall, with slender branches covered with minute, grey, stellatehairs.

Leaves: Simple, alternate, $1.5-7.5 \mathrm{~cm}$ long and 0.5-2.5 cm wide, lanceolate to linear, apex acute, margins serrate, base subcordate or rounded, minutely stellate-hairy on both surfaces, pinnately veined.

Flowers: Pale yellow or orange, axillary, solitary or in clustersof 2-3.

Fruits: $\quad 5-6 \mathrm{~mm}$ in diameter, mericarps 5-11,2-2.5 mm long with 2 awns 1-2 mm long, glabrous, dark brown.

Seeds: Trigonous, smooth and black.

## Sida cordata (Burm.f.) Borssum.

Common Name : Heartleaf fanpetals<br>Family : Malvaceae

Habit: Prostrateor decumbent, ascending herb.
Stem: Upto 50 cm tall, slender, often with woody base, trailing, densely stellate-pubescent.

Leaves: Simple, alternate, 1.5 cm long and $1-5 \mathrm{~cm}$ wide, orbicular to ovate, baseshallowly cordate, apex acute or acuminate, margins crenate-serrate with alternate, short teeth, glabrate or thinly stellate-hairy on both surfaces, palmately 5-7 veined.

Flowers: Axillary, 1.3-1.5cm across, paleyellow, solitary on jointed pedicels $1.2-3.8 \mathrm{~cm}$ long in the axils of leaves or in pairs on short branchlets.

Fruits: Mericarps5, 2-2.5mmlong, glabrous or shortly hairy at apex, usually awnless.

Seeds: 2 mmlong, ovoid, brownish-black, glabrous.

## Sida cordifolia L.

## Common Name : Heart-leaf sida <br> Family : Malvaceae

Habit: Erectundershrub.
Stem: Clothed with stellateand spreading hairs.
Leaves: Cordate-ovateor oblong, crenate-serrate.
Flowers: Yellow, axillary, solitary and clustered at ends of branches.

Fruits: Schizocarp transversely rugulose, margins ciliate, mericarpsawned.

Seeds: Ovoid or trigonous, brown or black.

## Sida rhombifolia L.

## Common Name : Arrowleaf sida <br> Family : Malvaceae

Habit: Anerect, annual or perennial undershrub.
Stem: Up to 1.5 m tall with string, wiry, flexuose branches.

Leaves: Simple, alternate, $3.5-10 \mathrm{~cm}$ long and $1-5 \mathrm{~cm}$ wide, highly variablein sizeand shape, usually rhomboid-lanceolate, apex acute, acuminateor obtuse, base cuneate or rounded, margins serrate, glabrate or stellate-hairy above, greypubescent beneath.

Flowers: Yellow or rarely white, $1-2 \mathrm{~cm}$ across, solitary or in 2-5-flowered clusters in leaf axils or on shortbranchlets.

Fruits: Mericarps 9-12, 2.5-3.5 mm long, trigonous, sparsely pubescent, short or long, awns up to 1 mmlong.

Seeds: 2 mm in diameter, subreniform, smooth, dark brown or black.

## Sida spinosa L.

## Common Name : Prickly fanpetals <br> Family : Malvaceae

Habit: Anerect, annual or perennial undershrub.
Stem: $\quad 30 \mathrm{~cm}$ to 1 m tall, stellatepubescent.
Leaves: Leaves with filiform, 2-5 mm long stipules; blade $0.5-4 \mathrm{~cm}$ long, $0.3-2.5 \mathrm{~cm}$ broad, lanceolate to ovate, oblong or somewhat orbicular, rounded at base, acute or obtuse at apex, serrate, usually cinereous on both surfaces.

Flowers: Axillary, solitary or 2-5 in fascicles in terminal branches; white.

Fruits: Depressed, globose, pubescent above; mericarps 5, membranous, 2-3 mm long, trigonous, radially striately nerved, apically with 2, 0.5-0.8mm long, divergentawns

Seeds: $\quad 1.5 \mathrm{~mm}$ long, glabrous, brown to black.

## Sisymbrium irio L.

## Common Name : London rocket <br> Family : Brassicaceae

Habit: Anerect annual herb.
Stem: Sparsely branched, glabrous, softly pubescent.
Leaves: Stalked, basal leaveslyrate-pinnatifid.
Flowers: Minute,inlax racemes, paleyellow.
Fruits: Curved, valves3nerved.
Seeds: Lightyellow-brown.

## Solanum elaeagnifolium Cav.

Common Name : Silverleaf nightshade<br>Family : Solanaceae

H abit: An erect or subscandent annual herb, up to 1 m high.
Stem: Cylindrical, sparingly branched, with a few scattered reddish prickles, herbaceous except at the base. Yellow to brown coloured prickles usually occur on the stem and also the main veins of theleaves.

Leaves: Dark green to pale greyish green, petiolate, lanceolate, obtuse or acute at the tip, rounded or truncate at the base, with entire or wavy margin.
Flowers: The inflorescence is a solitary cyme of 15-20 flowers, with long peduncules; flowers bright blue to purple but sometimes white with yellow anthers.
Fruits: Irregularly dehiscent berry, initially spherical, green (with white patches) and fleshy, drying and becoming yellow to orange ( $10-15 \mathrm{~mm}$ in
 diameter) at maturity.

Seeds: Smooth, flat, greenish-brown, 2-3 mm in diameter, closely resembling those of tomatoes.

## Solanum nigrum L.

## Common Name : Black nightshade <br> Family <br> : Solanaceae

Habit: A variableannual herb.
Stem: Up to 1 m tall with an erect, glabrous or sparsely pubescent stem and divaricate branching pattern.

Leaves: $\quad 2.5-9 \mathrm{~cm}$ long and $2-5 \mathrm{~cm}$ wide, ovate or ovateIanceolate, glabrous, thin, margins subentireto sinuately toothed, tapering into the petiole, apex subacuteor acumi nate.

Flowers: Small, white, borne in drooping, umbellate 3-8 flowered cymes.

Fruits: Berries globose, 5-8 mm in diameter, red, yellow or purplish-black when ripe.

Seeds: Numerous, disc-shaped, 1.5 mm in diameter, yellow, minutely pitted.

## Solanum sisymbrifolium Lam.

Common Name : Sticky nightshade<br>Family<br>: Solanaceae

| Habit: | An annual or perennial, erect, rhizomatous herb, 1 mtall . |
| :---: | :---: |
| Stem : | The stem and branches are viscid, hairy, and armed with flat, orange-yellow spines up to 15 mminlength. |
| Leaves: | Ovate to lanceolate leaves are borne on petioles, 1-6 cm long and are pubescent both above and below with stellate and glandular hairs. The leaves arepinnately divided into 4-6 coarse lobes and may be up to 40 cm long and 25 cm wide. |
| Flowers: | Inflorescence internodal, unbranched raceme composed of 1-10 perfect or staminateflowers. The 5-parted flowers are white, light blue, or mauve, about 3 cm in diameter, and are subtended by ahairy calyx. |
| Fruits: | Red, succulent, globular berries are $12-20 \mathrm{~mm}$ in diameter. |
| Seeds: | Paleyellow, 2.9-3.2mmlong. |

## Solanum torvum Sw.

## Common Name : Turkey berry Family <br> : Solanaceae

Habit: Armed shrub.
Stem: Usually 2 or 3 m in height and 2 cm in basal diameter, but may reach 5 m in height and 8 cm in basal diameter. The spines are short and slightly curved and vary from thick throughout the plant including the leaf midrib to entirely absent.

Leaves: Opposite or one per node, broadly ovate with theborder entireor deeply lobed.

Flowers: White, tubular with 5 pointed lobes, and grouped in corymbiform cymes.

Fruits: Berries that grow in clusters of tiny green spheres, 1 cm in diameter, that look like green peas, becomeyellow when fully ripe.

Seeds: Numerous, flat, round, brown.

## Solanum viarum Dunal.

Common Name : Tropical soda apple Family : Solanaceae

Habit: Bushy, prickly herbaceous perennial.
Stem: Up to 2 m tall, more commonly 1 m tall; stems armed with broad-based, straight or downward-pointing prickles and clothed in a mixture of stellate and simple glandular or non-glandular hairs.

Leaves: Alternate, simple, clearly petioled, prickly; blades oval-triangular, nearly as broad as long, to 20 cm long and 15 cm wide, angular-lobed; surfaces dense with fine soft hairs giving blades a vel vety sheen; veins prickly.

Flowers: White, in small terminal clusters.
Fruits: A globoseberry, 2-3cm wide, green with dark veining, like a tiny watermelon, when immature, dull mediumyellow when ripe.

Seeds: Flattened, reddish brown.

## Solanum xanthocarpum Schrad. \& Wendl

Common Name : Yellow berried nightshade Family : Solanaceae

Habit: Prostrate, diffuseprickly herb.
Stem: Woody at the base, much branched, armed with straight, compressed, yellow prickles, glabrous exceptstellatehairy young plants.

Leaves: $\quad 30-80 \times 25-50 \mathrm{~mm}$, elliptic-oblong, sinuate to deeply lobed, dark-green above; lobes unequal, obtuse or acute, often toothed or lobulate.

Flowers: Bluish purple.
Fruits: Globose, green with whitestripes, turn yellow when ripe.

Seeds: Circular,smooth.

## Sonchus asper (L.) Hill.

## Common Name : Spiny sowthistle Family : Asteraceae

Habit: Anerectannual herb.
Stem: Slender, simple or sparingly branched, glabrous.

Leaves: Basal leaves in a rosette. Upper leaves sessile, slightly rugose, elliptic-oblong, half amplexicaul, with rounded. Appressed auricles; spinousor simpledentate.

Flowers: Head solitary, yellow, gland-hairy peduncle, sub-umbellatecorymb.

Fruits: Achene compressed, the faces faintly rugose betweentheribs. Pappushairswhite.

## Sonchus oleraceus L.

## Common Name : Smooth sowthistle Family : Asteraceaea

Habit: Anerect annual herb.
Stem: Grooved, sub-umbellately branched, glabrous.
Leaves: Thin, sessile, obovatelanceolate, base half amplexicaul, dentate.

Flowers: Headsyellow, in irregular umbellatecymes.
Fruits: Achene compressed, narrowly obovoid, ribbed, distinctly muriculate, light brown. Pappuscopius, white, longer than theachene.

## Sopubia delphinifolia (L.) D on..

## Common Name : Common sopubia Family : Scrophulariaceae

Habit: Anerect annual herb.
Stem: $\quad 25-60 \mathrm{~cm}$ tall, much branched, branches 4 grooved, glabrous.

Leaves: Pinnatisect, 2-3 cm long, segments filiform or linear, passing into simple, floral bracts.

Flowers: Rosecolored or purple, in solitary or axillary or few flowered terminal racemes.

Fruits: Capsuleoblong, aslong asthecalyx.
Seeds: Numerous, truncate, longitudinally striate.

## Sorghum halapense (L.) Pers.

Common Name : Johnson grass<br>Family : Poaceae

## Spergula arvensis L.

## Common Name : Corn spurry Family : Caryophyllaceae

Habit: A diffuse annual herb.
Stem: Branched from theroot, grooved, semiterete.
Leaves: In pseudo whorls, fleshy, linear-subulate, spreading.

Flowers: Small, white.

Fruits: Capsuleglobose, fivevalved.
Seeds: Circular, thick lens shaped in cross section; margins winged with onesmall notch. Greyish black to black, marginsusually light brown.

## Sphaeranthus indicus L.

## Common Name : East Indian globe thistle Family <br> : Asteraceae

Habit: Annual herb, 30 cm tall.
Stem: Much branched, strongly-scented with winged stem and the wings toothed. The stem and branches arespreading, glandular and hairy.

Leaves: Leaves alternate, obovate-oblong, narrowed at thebase, dentateand serrate.

Flowers: Flowers occur in purple spherical heads, 8-15 mm , consisting of numerous purple or pink tiny flowers.

Fruits: Achene, glabrous, stalked.

## Sphenoclea zeylanica G aertn.

## Common Name : Chickenspike Family : Sphenocleaceae

Habit: Anerect annual herb.
Stem: 7-150 cm tall, smooth and fleshy, hollow, much branched and with white, spongy (aerenchymatous) tissues at base.

Leaves: Simple and spirally arranged, light green; blades oblong tolance-shaped, narrowed at the tip, 10 cm long, borneon shortstalks.

Flowers: Inflorescence green, cylindrical, 7.5 cm long dense terminal spike; flowers densely crowded, whiteto greenish, sessile.

Fruits: A flat, 4-5mmdiameter globular capsule.
Seeds: Yellowish brown, 0.5 mm long.

## Spigelia anthelmia L.

## Common Name : West Indian pinkroot <br> Family : Spigeliaceae

Habit: Annual herb.
Stem: $\quad 50-70 \mathrm{~cm}$ high, unbranched, or with few pairs of branches arising near the base. Stem erect, cylindrical, green, glabrous, with a few remote pairs of small leaves and an apical pseudowhorl of four larger leaves.

Leaves: Lamina ovate-oblong to ovate-lanceolate, 3-10 x 1-3 cm, herbaceous, scabrous above, glabrous beneath, cuneate and often decurrent at the base, attenuate at the apex. Leaves with interpetiolar, broadly triangular, blunt, glabrousstipules.

Flowers: Inflorescence terminal in the axils of the whorled upper leaves, upto 15 cm long. Flowerswhiteto red or purplish.

Fruits: Capsule4-5x5-6mm,tuberculate.
Seeds: Obliquely ellipsoid or ovoid, $1.5-2 \mathrm{~mm}$, dull brown, tuberculate.

## Spilanthes acmella (L.) L.

## Common Name : Pellitary <br> Family : Asteraceae

## Spilanthes calva DC.

## Common Name : Para cress <br> Family : Asteraceae

Habit: An annual herb.
Stem: Up to 60 cm tall; erect or decumbent at base, moreor lesshairy.

Leaves: Opposite, triangular ovate or lanceolate, margins dentate or almost entire, sparsely pubescent beneath.

Flowers: Flower heads ovoid, pale yellow or white, long-peduncled, solitary or in terminal panicles.

Fruits: Achenes obovate to trigonous with ciliate edges.

## Sporobolus diander (Retz.) P. Beauv.

## Common Name : Indian dropseed Family : Poaceae

H abit: Perennial, tufted herb.
Stem: Nodesglabrous.
Leaves: Leaf blades linear, flat, convolute; sheaths glabrous.

Flowers: Spikelets racemosely arranged in terminal contracted panicles.

Fruits: Caryopsisobovoid.

## Stachytarpeta indica (L.) V ahl.

Common Name : A aron's rod<br>Family<br>: Verbenaceae

Habit: An erect, glabrous, dichotomously branched annual or perennial herb.

Stem : Usually 30-90 cm high; young branches nearly quadrangular.

Leaves: Oblong-elliptic, 5-10 cm long and 2.5-3.8 cm wide, apex acute or obtuse, margins coarsely serrate, base tapering and decurrent into the obscurepetioles.

Flowers: Sessile, borne in long, slender, nearly continuous glabrous spikes up to 30 cm long, the rachis hollowed out beneath each flower; deep blue or purple, rarely white, tube 1 cm long, slightly curved, hairy inside.

Fruits: Capsules pear shaped, ribbed, 3-4 mm long, enclosed in the calyx, breaking into 2 oblong pyrenes.

Seeds: Seedsblack, flattened.

## Stellaria media (L.) Vill.

## Common Name : Common chickweed Family : Caryophyllaceae

Habit: Diffuse to ascending, annual, decumbent, glabrous, branching herb.

Stem: Flaccid, rooting from the lower nodes, line of hairson thebranches.

Leaves: Ovate-ellipticto oblong, spathulate.
Flowers: White, numerous, axillary.
Fruits: Capsuleovoid, exceeding thecalyx,6valved.
Seeds: Circular, flattened, surface covered with conspicuous curved rows of short irregular projetions; Greyish brown to reddish brown.

## Stemodia viscosa Roxb.

## Common Name : Sticky blue rod <br> Family : Scrophulariaceae

## Striga asiatica (L.) Kuntze.

## Common Name : Witch weed. <br> Family <br> : Orobanchaceae

H abit: An annual obligatehemi parasite, 15-20cmtall.
Stem: Green, square in cross section, 1-2.5 mm in diameter. Under ground stems are round with scale elike leaves and white, but turn blue when exposed to air. The roots are succulent, round, without root hairs, and found attached to the hostroot system.

Leaves: Opposite, narrow; each pair born at right angle totheprecedingone.

Flowers: Variously colored, white, purple, pink or red; born in oppositepairs or alternately in terminal leafy inflorescence.

Fruits: Loculicidal capsule, black, ellipsoid, 0.4-2 mm, two valved.

Seeds: Elliptic, ovate, oblong, ocassionally D-shaped, triangular, rhombic or irregular; dust like, 0.20.6 mm long, $0.1-0.3 \mathrm{~mm}$ wide and thick. Orangeto golden brown or light to dark brown

## Synedrella nodiflora (L.) G aertn.

## Common Name : Cinderella weed Family : Asteraceae

H abit: A small, erectannual herb.
Stem: $\quad 25-50 \mathrm{~cm}$ tall with grooved stems.
Leaves: Opposite, broadly ovate-elliptic, hairy.
Flowers: Flower heads yellow, heterogamous, sessile, axillary and between forks of branches.

Fruits: Achenes black, ribbed; pappus of 2-3 bristly awns.

## Tephrosia purpuria (L.) Pers.

Common Name : Wild indigo<br>Family : Fabaceae

Habit: A polymorphic, much-branched, suberect, perennial herb.

Stem: Usually $30-60 \mathrm{~cm}$ tall; branches spreading, glabrousor sparsely pilose.

Leaves: Leaves imparipinnate, 5-15 cm long; petiolets $6-12 \mathrm{~mm}$ long. leaflets $7-12$, narrow, elliptic to oblanceolate, apex obtuse or retuse, mucronate, baseacuteor cuneate, $2-2.8 \mathrm{~cm}$ long and $0.8-1.3 \mathrm{~cm}$ wide, glabrous above, silky pubescent beneath, with numerous closely parallel veins.

Flowers: Pink, red or purple, 4-9 mm long, borne in many flowered, leaf-opposed racemes.

Fruits: Pods slightly curved, compressed, glabrescent, dehiscing by both sutures, 3-5 cm long and 4 mm wide, containing $4-10$ seeds.

Seeds: 4 mm long, suborbicular, compressed, greenish-grey to dull brown, smooth.

## Themeda triandra Forssk.

Common Name : Red oat grass<br>Family : Poaceae

H abit: Tufted perennial, 45-180cmhigh.
Stem: Angular, ribbed, thickened above the node, moreor less densely hairy.

Leaves: Extremely variable, from hairy to non-hairy and green to bluish-green in colour. The basal leaf sheaths are flattened and this tendency continues through the leaf blades which are often folded, especially when young. older leaveshavered or browntinge.

Flowers: Inflorescenceis an open paniclewith groups of spikelets situated on long thin subsidiary branches. Each unit is normally supported by a leaf-like structure, the spathe, which is often tinged with mauve, purple, brown or reddishbrown. Each group of spikelets consists of 6 sterile and one fertile seed bearing unit. This fertile unit produces a long brown to black awn which is attached totheseed.

Seeds: Large(up to 10 mm ) and shiny black.

## Trianthema portulacastrum L.

## Common Name : Horse purslane <br> Family <br> : Aizoaceae

Habit: An annual herb.
Stem: A prostrate mat or clump with stems up to a meter long. It is green to red in color, hairless except for small lines of hairs near the leaves, and fleshy.

Leaves: Leaves have small round or oval blades up to 4 cm long borneon short petioles.

Flowers: Solitary flowers occur in leaf axils. The flower lacks petalsbuthaspurple, petal likesepals.

Fruits: Curved, cylindrical capsuleemerging from the stem.

Seeds: Kidney-shaped, spiral, ended by a beak, 2 mm in diameter.

## Tribulus terrestris L.

## Common Name : Puncture vine <br> Family : Zygophyllaceae

Habit: A moreor lesspubescentannual herb.
Stem: Stem with prostrate or decumbent primary branches up to 1.5 m long radiating from the crown of thetaproot.

Leaves: Opposite, paripinnate, up to 5.5 cm long, oneof each pair usually smaller than the other; leaflets 3-6 pairs, 6-12 mm long, oblong to linear-oblong, with silky hairs on both surfaces, apex mucronate, base rounded oblique.

Flowers: Pale-yellow to yellow, $0.7-2 \mathrm{~cm}$ in diameter, leaf-opposed, solitary.

Fruits: A schizocarp, globose, 1-1.5 cm across, consisting of 5 woody cocci, each with 2 pairs of hard, sharp, divaricate spines, one pair longer than theother.

Seeds: Seeds several in each coccus with transverse partitions between them; minute, oblong.

## Trichodesma indicum (L.) R. Br.

## Common Name : Indian borage <br> Family : Boraginaceae

Habit: A nerect, spreading, branched, annual herb.
Stem: About 50 centimeters in height, with hairs springing fromtubercles.

Leaves: Stalkless, opposite, lanceolate, 2 to 8 centimeters long, pointed at thetip, and heartshaped at thebase.

Flowers: The flowers occur singly in the axils of the leaves. The flower tube is pale blue, with the limb about 1.5 centimeters in diameter, and the petalspointed.

Fruits: The fruit is ellipsoid, and is enclosed by the calyx.

Seeds: The nutlets 4, about 5 mm long, and rough on the inner surface, smooth and polished on the back; greyish white.

## Trichodesma zeylanicum (Burm f.) R. Br.

## Common Name : Camel bush <br> Family <br> : Boraginaceae

Habit: Densely bristly-hairy annual or perennial herb or shrub.

Stem: $1 m$ high, smooth to hispid; taproot welldeveloped. Stem and twigs clothed in white scabroushairs.

Leaves: Basal leaves opposite, becoming alternate up stem; Iamina linear-oblong to narrow-ovate, $3.5-10.5 \mathrm{~cm}$ long, $7-20 \mathrm{~mm}$ wide, apex acute, surfaceshispid.

Flowers: 15-20mm diameter, blue, rarely white.
Fruits: The fruit is ellipsoid, and is enclosed by the calyx. Calyx lobes ovateor rounded at thebase.

Seeds: $\quad$ Nutlets 4; 4-5 mm long, outer surface smooth and mottled, inner surface wrinkled, grey, dotted, brown on dorsal surface.

## Tridax procumbens L.

## Common Name : Coatbuttons Family <br> : Asteraceae

Habit: A hispid, procumbentherb.
Stem: Up to 60 cm tall; base woody, sometimes rootingatthenodes.

Leaves: Ovate, 2-7cm long and 1-4cm wide, apex acute or acuminate, base cuneate, margins serrate to coarsely dentateor trilobed.

Flowers: Flowers borne in small, solitary, terminal heads; peduncles $10-20 \mathrm{~cm}$ long; ray florets strap-shaped, white; discfloretsyellow.

Fruits: Achenes black, turbinate, 2-2.5 mm long with feathery pappus.

## Trifolium fragiferum L.

## Common Name: Strawberry clover Family : Fabaceae

Habit: An annual herb.
Stem: Creeping stem that roots at stemjoints(nodes), forminglargeclumps.

Leaves: The leaves are borne on long petioles. Each blade is made up of usually threeserrated oval leafletsup to 2 to 2.5 cm long.

Flowers: Inflorescenceglobular and compact, $10-12 \mathrm{~mm}$ in diameter, with pink or purplish red florets, and when ripe, become reddish and resemble straw berry fruits.

Fruits: Fruiting heads are round, sparsely hairy, tan to reddish brown and look similar to hairy, unripe raspberries because of the clustered
 individual tiny fruitsthat form thehead.

Seeds: Heart-shaped and coloured light brown with dark brown flecks.

## Trigonella polycerata auct. non Linn.

## Common Name : Wild fenugreek Family : Fabaceae

H abit: Annual or perennial herb.
Stem: Reddish and sparsely puberulous.
Leaves: Pinnately trifoliolate, leafletstoothed.
Flowers: Inflorescence a pedunculate axillary raceme . Flowers pedicellate, mostly yellow, or less often purplish.

Fruits: Pod spirally coiled or rarely fal cate, sometimes provided with tubercles or spines at the margin, mostly indehiscent, 1to many seeded.

Seeds: Oblong-cylindrical or oblong-rhomboid, 2 mm long, brownish, finely tuberculate.

## Triumfetta rhomboidea Jacq.

## Common Name <br> Family <br> : Burbush <br> : Tiliaceae

Habit: A herbaceousperennial.
Stem: Up to 1.5 m tall, often woody at the base; branches slender, pubescent with simple hairs when young, becoming glabrous.

Leaves: Variable, simple, alternate; blade ovate to rhomboid in shape with 3-5 lobes, sometimes nearly as wideas broad, and $2-10 \mathrm{~cm}$ long. Leaf margins irregularly serrate, leaf surfaces softly-pubescent with stellate hairs, blade palmately veined.

Flowers: Yellow, 5-6 mm across, in dense terminal and leaf opposed cymes.

Fruits: Small, globose or ovoid $4-6 \mathrm{~mm}$ in diameter, with small, smooth, hooked, spines.

## Typha angustata Bory \& Chaubard.

Common Name : Southern cattail<br>Family : Typhaceae

H abit: A tall, robust perennial march plant.
Stem: Usually 1.5-3m high with a creeping, branched rhizome.

Leaves: Distichous, semicylindrical above the leaf sheath, spongy up to 3 m long and 2-3.5 cm wide, often longer than the flowering stalk, narrower abovethesheath.

Flowers: Minute, borne on cylindrical spikes, 0.8-2.2 cm in diameter, the male and female spikes often widely separated on the stalk, sometimes on different plant; male spikes $25-50 \mathrm{~cm}$ long, consisting of deep-yellow anthers; female spikes $22-38 \mathrm{~cm}$ long, palebrown.

Fruits: Fusiform, dehiscent by an apical lid.

## U rena Iobata L.

$$
\begin{array}{ll}
\text { Common Name } & : \text { Caesarweed } \\
\text { Family } & : \text { M alvaceae }
\end{array}
$$

H abit: An erect, variable, stellate-pubescent to stellatetomentoseherb or undershrubup to 2.4 mtall.

Stem: Single stem emerging from the ground, but produces several stems or major branches low in the stem. Nearly smooth bark is tough and fibrous, brown on theoutsideand green within.

Leaves: Variable in size and shape, roundish or ovate, angled or shallowly lobed, 1-10 cm long and wide, base cordate, palmately 3-9-veined from base with linear, extra-floral nectarines (glands) at base of midrib beneath, margins serrate to crenate, lobes generally acuteor acuminate.

Flowers: Bright pink, bornein axillary clusters, sometimes forming leafless, terminal racemes.

Fruits: Capsule, 1 cm long, depressed-globose, indehiscent, densely pubescent, covered with blunt spines, each spinehaving 2 straight bristles pointing downwards.

Seeds: Rounded on the back, wedge-shapped on the inner side, smooth, grey to dull black.

## U rena sinuata L.

## Common Name : Bur mallow <br> Family <br> : Malvaceae

Habit: Anerect annual undershrub.
Stem: Almostsimilar to that of U rena lobata.
Leaves: $\quad 2.5-8 \mathrm{~cm}$ long, orbicular in outline, $3-5$ veined from base, more or less stellate-hairy on both surfaces, base cordate or truncate, irregularly lobed below the middle; lobes 3-5 or more, dilated upwards, with rounded sinuses, marginsserrate, palebeneath.

Flowers: Rose-colored, 2-2.5cmin diameter.
Fruits: Capsule, 1 cm long, depressed-globose, indehiscent, densely pubescent, covered with blunt spines, each spine having 2 straight bristles pointing downwards.

Seeds: Rounded on the back, wedge-shapped on the inner sidesmooth, black.

## Verbascum chinense (L.) Santapau FI.

## Common Name : Chinese mullein <br> Family : Scrophulariaceae

Habit: An annual erectherb.
Stem: Upto 75 cm tall.
Leaves: $\quad 6-14 \times 2-5 \mathrm{cn}$, lyrate-pinnatifid, with oblong, obtuse, crenate-dentatelobes, pubescent.

Flowers: Yellow inlaxglandular hairy racemes.
Fruits: 5-7 mm across, sub-globose, apiculate, glandular.

Seeds: $\quad 0.4 \mathrm{~mm}$ long, oblong, truncate, grooved, black.

## Verbesina encelioides (Cav.)Benth.

## Common Name : Golden crownbeard Family : Asteraceae

Habit: Anerectannual herb.
Stem: 0.3-1.6mtall, covered with finewhitehairs.

Leaves: Toothed or lobed; lower leaves are opposite and triangular, while the upper leaves are alternate and lance shaped. Both upper and lower leaves feature fine white hairs on the underside.

Flowers: Flower heads are found on elongated stalks and resemble small sunflowers, $2.5-5.1 \mathrm{~cm}$ in length,. either solitary, or in clusters of up to 3 heads; yellow to brightyellow in color.

Fruits: Achenes are grayish-brown, flat, and winged al ong the margins. Seed size ranges between $5.4-6.7 \mathrm{~mm} \times 3.1-3.66 \mathrm{~mm}$, covered with fine hairs.

## Vernonia cinerea (L.) Less.

## Common Name : Little ironweed Family : Asteraceae

Habit: Anerector rarely decumbent annual herb.
Stem : $\quad 15-75 \mathrm{~cm}$ tall, slender, grooved and ribbed.
Leaves: $\quad 2.5-5 \mathrm{~cm}$ long and 2-3.8cm wide, variable in shape, broadly elliptic or lanceolate, apex obtuse or acute, base cuneate, margins irregularly toothed or shallowly crenateserrate, membranous to coriaceous, sparsely hairy on both surfaces.

Flowers: Florets pinkish-purple, heads about 20flowered, 6 mm in diameter, forming rounded or flat-topped, paniculate, terminal or axillary, corymbs.

Fruits: Achenes 1.3mm long, 3-4angled, densely silky pubescent, slightly narrowed at base.

## Vicia hirsuta (L.) S.F. Gray.

## Common Name : Tiny vetch <br> Family : Fabaceae

Habit: An annual herb.
Stem: Decumbent-ascending, 4-angled, winged, up to 60 cm tall.

Leaves: Leaflets 4-10 pairs, 4-13 X 1.5-3.0 mm, linear oblong, apex emarginate, truncate and mucronate, baseobtuse.

Flowers: Racemes 2-6 flowered, axillary; flowers pale blue.

Fruits: Pods 8-10 X 3.5-4 mm, elliptic-oblong, flat, pubescent.

Seeds: 2-3mmacross, compressed.

## Vicia sativa L.

## Common Name : Common vetch Family <br> : Fabaceae

Habit: An annual herb.
Stem: Decumbent-ascending, up to 60 cm tall.
Leaves: Leaflets 3-8 pairs, 1.5-2.5×0.2-0.4cm, linearIanceolateor oblong, mucronate, baseobtuse.

Flowers: Solitary or paired, axillary, purplish.
Fruits: Pods 3-4.2 x 0.4-0.6cm, narrowly oblong, beaked, pubescent.

Seeds: 3-4 mmacross, blackish.

## Vicoa auriculata Cass.

## Common N ame : Ladies' false fleabane Family : Asteraceae

Habit: Anerectannual herb.
Stem: Reddish and sparsely puberulous.
Leaves: Ovate-lanceolate, cordate, auriculate, sessile.
Flowers: Heads yellow, solitary, terminal or leafopposed.

Fruits: Achenes angled.

## Volutarella divaricata Benth \& Hook.

## Common Name : Oligochaeta Family : Asteraceae

Habit: A procumbentor spreading herb.
Stem: Angular, ribbed, thickened above the node, moreor less densely hairy.

Leaves: Sub-sessile, 2-4 cm long; lower leaves oblongobovate or lyrate, upper ones sinuately pinnatifid, entire or toothed with mucronate lobes, sparsely pubescent.

Flowers: Heads 1.2-2.2 cm long, ovoid, axillary and terminal, purplish.

Fruits: Achenes $4-5 \mathrm{~cm}$ long, acutely angled, pitted in the grooves; dull brown. Pappus hairs many, 5-16mmlong, unequal, shining brown.

## Waltheria indica L.

## Common Name : Sleepy morning. Family : M alvaceae

Habit: A short-lived shrub or subshrub sometimes reaching 2 min height.

Stem: A single, strong stem emerging from the ground, but frequently branches near the ground. The young stems and leaves are covered with agrey, velvety hairs.

Leaves: Alternate, narrowly ovate or oblong with a rounded to heart-shaped base, irregularly serrateedges, and a rounded to acutetip.

Flowers: Inflorescences usually are denseclusters in leaf axils, that contain fragrant, yellow to orange flowers.

Fruits: Capsulesmall,round,2mmdiameter.
Seeds: Obovoid,tiny, black.

## W edelia chinensis (O sbeck) M err.

Common Name : Chinese wedelia Family : Asteraceae

Habit: A hairy annual herb.
Stem: Spreading with branches usually less than 50 cm long.

Leaves: Oblong to oblong-lanceolate, $2-4.5 \mathrm{~cm}$ in length, and narrowed at both ends. The margins are entire or obscurely toothed; both surfaces are covered with sharp-pointed, appressed, straight, and stiff hairs.

Flowers: The heads are stalked, about 1 cm in diameter, and yellow.

Fruits: Theachenes arenearly cylindric, hairy.

## Xanthium strumarium L.

## Common Name : Common cocklebur <br> Family : Asteraceae

Habit: Annual herb.
Stem: Stout and hairy, much branched, up to 1.5 m tall.

Leaves: Leaves broadly triangular ovate or suborbicular, scarbid or hispid on both surfaces, apex acute, often 3-5 lobed, irregularly serrate, base some what cordate or shortly cuneate; petioles $2.5-7.5 \mathrm{~cm}$ long.

Flowers: Flower heads monoecious, numerous, whiteor green, in terminal and axillary racemes; male heads in upper axils, globose; female heads in the lower axils, ovoid, covered with hooked bristles, ending in 2 strong hooked beaks.

Fruits: Achenes 1.3 cm long, obovoid, compressed, enclosed in a hardened, spinescent involucre.

## Zornia gibbosa Spanoghe.

Common Name : Grasslikezornia Family : Fabaceae

Habit: Annual herb.
Stem : Prostrateto suberect, up to 50 cm tall, branches prostrateor ascending, glabrous or pubescent.

Leaves: Leaf bifoliolate, petiole $6.0-20 \mathrm{~mm}$ long; leaflets sessile, $0.7-3.0 \mathrm{~cm}$ long, $3.5-10 \mathrm{~mm}$ broad, Ianceolate, linear-Ianceolate or linear, glandular punctatebelow, glabrous.

Flowers: Small in 3-12 flowered spicate racemes, 2.5 cm long. Peduncles slender. Bracts foliaceous, up to 1.3 cm long, black dotted, completely enclosing theflower and often theentirepod.

Fruits: Pod 1-6 jointed, enclosed by the bracts or exerted, joints 2.5 mm long and wide, indehiscent, covered with short, straight, fulvousspines.

Seeds: Ovoid to rounded in outline, seed surface
 smooth, olive, brown, or black.
